Hey DALE ....You are the best..... And I wish to thank you for all that you have given me. The top grade ATS3B you gave me..... From your heart.....You put your heart and soul into it.
All the Keys out there.....Dale helped me out
Tonight you need to run the Junkers. I gave you as a gift....I dont think the schurr from grandpa would work.
Cheating.....LOL HI HI..... Beats a vibroplex buy far. And that italian thingy...We all know what I am talking about. Dale gets a bravo Zulu..... 73..... Raymond.

Subject: RE: [AT_Sprint] power output ... ATS4B

Hank you have it, Fred.. if you want the most effecient tx to be used even just occasionally at full power.. the finals will extend their life for you, if you optimize the power vs current using 12v as a supply. Then drop to a 9v supply for normal ops, and you'll find around 3.5 watt out, easily.. and it is fun to "blow" the other S meter harder with the extra power if you just have to.
  The main difference is the effeciency at what voltage and results in a difference in current... with it tuned at 9 volts.. the max current for the finals occurs quicker... life is too short for that. (Finals life)...
Happy New Year.

Fred:

I believe, but I could be wrong, that tuning for maximum efficiency (or maximum power output) for a 9 volt power supply would NOT be the same as tuning the output filters for maximum efficiency (or maximum power output) for a 12 volt (nominal) power supply.

At least, that's what I understand from what I learned from building rigs back in the tube daze. Would not 3 watts out with 9 volt collector voltage present a different impedance to the input of a filter than 5 watts out with a 12 volt collector supply? This is just a gut feeling since I haven't done any calculations, and would have to consult several books to figure out how to go about such a solution. So, those more skilled in the art of impedance matching networks are left to a rigorous solution.

From: Scott Cowling
Topic: 7860 Message: 7860

Just got done with the ATS-4B on the 29th, and had a great SKN QSO for 30 minutes on a 9V battery!!! Try that with any other QRP rig and see how long it goes... Thanks, Steve, for a great rig!

At Fred's encouragement, I measured my power output and current draw on each band. This is straight off the bench, with the coils wound as close to evenly spaced as I could get them. No tuning yet!

(I had to build my NorCal QRP wattmeter so I could get these "highly accurate" readings. :-) This was a fun weekend!)

ATS-4B power out and current in @12VDC input voltage:
80M - 5.7W @ 600mA
40M - 5.7W @ 700mA
30M - 5.1W @ 580mA
20M - 4.8W @ 800mA
17M - 4.3W @ 500mA

ATS-4B power out and input voltage on 9V battery (no current measurements)
80M - 1.8W @ 8.3V
40M - 1.8W @ 8.3V
30M - 1.7W @ 8.2V
20M - 1.7W @ 8.5V
17M - 1.6W @ 8.5V

Looks like I might get some benefit on 40M and 20M by tweaking the coils, since the current seems a bit high for the power output.

Scotty WA2DFI

7861. ATS4A keyer memory spacing

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-01 20:57:29 UTC
From: K
Topic: 7861 Message: 7861

The morse spacing using the keyer memories on my ATS4A has always sounded to me like there is too much space between letters and words. Today I spent a little time looking at the firmware. I think I see the problem, but I would appreciate it if someone who knows this stuff better than me would verify this. I have not yet installed the programming header on my ATS4A, nor have I put together the parallel port programming interface, so this is all academic at this point.

First, it looks to me that the keyer memories correctly add a dot space between elements, but add 3 additional dot spaces between letters so that instead of the usual 3 dot lengths between letters there are 4 dot lengths. The relevant code is

```
msp1: bic #FL_SIDETONE,&flags
clr r5
ms_lp: cmp.b #3,r5
jne ms_lp
jmp mrs_lp3

mrs_ext: clr r5
m_exls: cmp.b #9,r5
jne m_exls
bit #FLB_KEEPMUTE,&bflag jc mrs_lp7
bis.b #PO_MUTE ;unmute
mrs_lp7: ret
```

It looks to me like the msp1: labeled instructions with the ms_lp1: cmp.b #3,r5 instruction give a dot space after the character.

The mrs_ext: instructions at the end of a character with the m_exls:
cmp.b #9,r5 instruction give 3 additional dot spaces. I think this
instruction should be changed to cmp.b #6,r5, so that the total letter
space is 3 dot spaces. The word space instruction is similar. It is

```
kwds: clr r5
kwdslp: cmp #0015h,r5
jne kwdslp
jmp kmelp3
```

The hex 15h is 21 which gives 7 dot spaces. This would be correct except that now there are already 4 dot spaces after the letter giving 11 total. Instead, I think the instruction should be changed to cmp #0012h,r5, which along with the letter space change above will give the correct 7 dot space total.

As far as I can see there aren't any side effects from making these changes. Could someone please verify this, if possible?

Thanks and 73,
Kevin w9cf

I did some work on the ATS-3B firmware last year so I just had a look at
that.

The code is the same, I suspect that Steve just copied it for each new
design, so it's probably wrong on all of them.

Humm, it seems you are correct, I forgot to include the inherent dot space added to the end of each element for spacing. The changes you propose would fix the letter and word spacing, but I kinda think having the slightly longer space between letter and words isn't a bad thing and am inclined to leave it as it is.

I've found the extra spacings allow for poor conditions, better than close spacings... and slower spacings are faster... in poor conditions, requiring fewer requests for repeats. Guess it all depends on what or how you are using your radio.

Steve,
Thanks for the quick response. It's a matter of taste. I like the shorter spaces partly because it matches my keying style. In any case, the only way my ATS4A will get changed is if I do it. I really appreciate it that you have included the firmware source, and that the board has the programming header connections. I hope that I can download the firmware without issues.

7866. Pedestrian mobile reboot of ATS-3

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-02 00:54:15 UTC
From: wa5bdu
Topic: 7866 Message: 7866

I was trying out a /PM arrangement as part of SKN today. I have a helical hamstick type antenna clamped to a backpack with a 16' trailing wire, for 20 meters. I'd checked earlier with the MFJ259B and the SWR is 2:1 or so minimum.

When I tried keying, the rig would immediately reboot on the initial key closure. I thought the SWR might have caused excess current draw, but it also could be the proximity of the antenna's field to the power, key, and earphone cords.

I tried using a 9V battery instead of the 12V AGM and that cured the problem. But I want full output in this compromise situation.

Tried a FT114-43 toroid with about 8 turns of the power cord through it as an RF choke. That did help but there were still enough reboots to prevent a QSO. I then tried chokes on the key and earphone leads as well and things seemed to get worse.

My next attempt will be to hook the counterpoise to the Altoids case instead of the base of the antenna (there's a pretty good coil of coax between the two). I may shorten some leads too.

My rig does seem to have the "reboot" mod: R22 is 270 ohms.

Any other ideas?

72,

Nick, WA5BDU

7867. T-Network Ant-Simulator

While we are on the subject of the ATS-4A, I'm building it now. Can anyone please confirm that the 3-lead IC near the D1 label, present in the board photo on page 19 and labeled WV4 on page 18, has been eliminated from the final design? I'm reasonably sure it is since there's no reference in the parts list.

7869. Re: [AT_Sprint] ATS4A keyer memory spacing

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-02 19:33:17 UTC
From: Michael Harnage
Topic: 7861 Message: 7869

The delay for the space between letters is cumulative not additive. In other words it's not 1+3 dit spaces. It's 3 dit spaces. R5 is only cleared once at the beginning of the space...

The word spacing is a little more complicated to follow but does appear that it adds an additional 7 in addition to the 3 already there after the last letter. So if you wanted you could change the word space to add 4 dit spaces vice 7.

7871. QRP ARCI contests/events scheduled for January, 2012

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-03 16:54:29 UTC
From: James Rodenkirch
Topic: 7871 Message: 7871

So, 2012 is here and there are two events during the month of January::

First
off is the 2012 QRP ARCI PET ROCK CELEBRATION this coming Saturday, 7 January, 2012 from 1500Z to 1800Z on 7 January 2012. Mode of operation is CW and the exchange is: Members send: RST, State/Province/Country, ARCI member number while Non-Members send: RST, State/Province/Country, Power Out

Dust off those xtal-controlled rigs and get in on this
neat, fun event. There are bonus points for xtal-controlled rigs so visit www.qrparci.org and click on the "QRP ARCI contest" link on the left to see the rules. If you're going to enter this event, or even if you aren't and are just "cruising around on the bands," please remember to visit the additional frequencies where rock-bound enthusiasts are hanging out these days, e.g., 7100 to 7125, as they sure would appreciate getting a chance to show off their rigs as well as gain experience via QSOs with us all!

Second is the 2012 QRP ARCI
Winter Fireside SSB Sprint that is scheduled for the 29th of January, 2012 from 2000Z to 2359Z. Mode of operation is SSB (I believe I have a microphone around here somewhere) and the exchange, for members is RS, State/Province/Country, ARCI member number while non-members send RS, State/Province/Country, Power Out

Again,
check the contest link at the web site for the "particulars" as there is a nice bonus point addition for operating portable! I'll be certain to wash my throat out with SOMETHING so I can join in the fun!

72, Jim Rodenkirch, K9JWV
QRP ARCI Contest Manager

7872. frequency at power up and DFE?

Yahoo group: AT_Sprint (2012 — 2013)

From: ka1stz
Topic: 7872 Message: 7872

I'm just realizing I may have a problem with the 4b I recently assembled. It always powers up on the same freq for each band, even if I change freqs and power down, then turn it back on. The frequencies it starts on are 3592.850, 7098.250, 10152.600, 14113.550, or 21133.200, depending on the band selected. Nothing I do will change the start up freq. Also when going into DFE I can enter a freq fine, but I do not see the X, ST, or RE on the bottom line as described in the manual. ??? Thoughts?
Thanks! -Gerry

Hi Gerry:

My 4b behaves in exactly the same way.

In DFE mode:
Although the X, ST, RE labels don't appear on the display, the corresponding pushbuttons (FN, SP and down-arrow) work as they should.

As far as the frequency storage goes:
When I went through the calibration sequence, the frequencies were reset to the original QRP ones (7.030, 14,060, etc).

I have found that if I'm on 7.015 MHz and switch to 20m, then back to 40m, I end up back on 7.015. If I turn the rig off then back on, it's at 7.015. So, my solution has been to switch bands momentarily if I want to store a new frequency.

73,
Rob KA8JBY

7874. ATS3-B output tweaking

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-04 15:19:40 UTC
From: Fred Maas
Topic: 7874 Message: 7874

Built my ATS3B in 2007. Ignorantly, I thought when I peaked the variable caps that I had simultaneously peaked output. Not ;-) So over the last week, I have been tweaking toroids to optimize output on the ATS3B. Both Dale, WC7S, and Carey, KX0R, offered invaluable guidance in the process and without whom I would have gotten nowhere. I had no idea what the output was on any band before I started.

Input current was monitored with an ammeter (multi-meter) in line from battery. Output was monitored with an RF probe like that shown on the website of N5ESE. Coils were adjusted in small increments one coil at a time seeking to optimize output, while staying somewhat below 800 mA total current.

Most bands required LF2 toroid to be as compressed as possible, and LF1 to be as spread as possible. Output on various bands rose dramatically. 40 meters wound up the lowest at about 4.2 watts. Carey advised trying to slightly increase the capacitance of C2F. A 151 cap was tacked across the 681 cap on the 40 meter plug-in module, resulting in 830 pf, and the output jumped up in line with the output from the other bands.

So I am now entirely satisfied with the output of the ATS3B on all bands.

Note that the output stated is an estimate. The readings from the RF probe are not usable with the equations, likely detuned by impedances of the meter, and can be considered relative only. The readings were estimated using my Elecraft K3 as a "standard." It is likely the actual outputs are several tenths of a watt lower than that which is implied by the K3.

So called "1st teak" was improvement based solely upon current input. "2nd tweak" results were made by also observing actual output with the RF probe. As Steve said a few days ago, both need to be monitored to really do it right.

ATS3B at 12.1 volts ... the 3S LiPO battery is generally between 11.1 and 11.6 volts in field operation which is a half watt lower.

Band Before 1st tweak 2nd tweak % impr

80 2.5 W 4.0 W 5.0 W 100%

40 3.5 W 4.0 W 5.5 W 60%

30 2.0 W 4.8 W 5.6 W 175%

20 4.6 W 4.8 W 5.6 W 25%

From: Steven Weber
Topic: 7872 Message: 7875

Yes, at the last moment two bugs crept into the firmware which kept the labels for the switches in DFE mode from showing up and the other from restoring the last used frequency on power up.

The first bug was a result of my adding a command to clear line 3 of the display, but I put it in the wrong place, which resulted in the switch labels to be written to an address not visable on the display.

The second problem was caused by my removing some lines of code, as I was running out of program memory space and wanted to free up some space. At the time it seemed those lines of code were redundant, having forgoten exacty why they were there. The frequency is stored as it should be, it just isn't restored on power up, which is why if you power up on another band first, then switch back, that last used frequency now shows up.

I've since corrected these problems and will upload the revised firmware to the files section of the group soon.

Hi Rob/Gerry:

My 4b behaves as Rob described for DFE and the frequency memory thing also caught my attention. Rereading Steve's User manual section several times and testing with a dummy load seemed to show that a band's frequency is stored for power-up recall only if something is sent. TUNE mode "use" does not count as sending. Hopefully this helps.

7878. ATS-4B files uploaded

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-05 18:15:27 UTC
From: Steven
Topic: 7878 Message: 7878

Gang,

I just uploaded some new files to a new folder named "ATS-4B" in the files section.

Assembly only instructions - has all the typos and little errors fixed for those who haven't started building yet.

Corrected schematic for the CPU section - this corrects the way the 3.3 V regulator is wired, which wasn't updated in the schematic sent with the kit.

ATS4B.s42 - Source code with the bug fixes.

72, Steve KD1JV

7879. New batch of ATS-4B now available

7880. Let The Fun Begin

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-06 03:23:39 UTC
From: dyarnes1
Topic: 7880 Message: 7880

I got an ATS4-B from the second batch, but I've been waiting to let some of the "errata" filter in. Decided it was time to start at least, since a lot of folks seem to be successfully up and going.

I'm fortunate to have a local ham friend (WR7A), who has a wonderful binocular microscope, and is also highly experienced with SMD stuff (He's an IBMer). I put together the ATS3, but a couple of those small IC's drove me nuts. So, with my friend's guidance, and a little spastic maneuvering coordinating hands and eyes through the microscope, I got the 3 smallest IC's mounted. Using a microscope is great, but takes a little getting used to. Anyway, those were the 3 parts I was dreading, but it went very well. I also got a lot of good advice from my friend about just how to attack these little devils. For one thing, I thought I had some pretty thin solder, but he's got some that is perfect! He also showed me a much better method of cleaning excess flux from the board, and that makes the process, and the result, look so much better. No real exotic tools, other than that wonderful microscope, but he says you can do just about as well with a good magnifying headset, which I have--an Optivisor, which is just about the same as the one he uses. Anyway, I'm a lot more confident now about mounting some of these really small IC's, so next time maybe I'll be less apprehensive. I still plan to let my friend critique the board when I get the rest of the SMD's installed. I don't expect to have too much difficulty with the rest of the parts, but it certainly never hurts to have an expert review your work.

By the way, when I was building the old ATS3, and having so much trouble with that really small IC, I happened to be talking to Dan Tayloe about it at an AZ ScQRPion meeting, and he suggested I just "slop" the solder on each side, then use solder removal braid, and a little flux, to "lift off" the excess solder. I was surprised how well that worked, but not as neatly as the method I used today with the microscope. Today, though, I think I learned a lot more about how to clean up the board properly afterwards. It's one thing to read about this stuff, but so much better to see it done properly by someone who really knows what he is doing!

I doubt I'll be through with this kit for a while yet. There are too many things on my "to do" list right now, but I'm sure looking forward to the process, particularly now that the "fear factor" has been substantially eliminated! Hi. The trick now is to keep SMD parts from flying off the workbench. Unfortunately, I know more than I wish I knew about that problem!

Hello:

So I want to build the cable to connect my ATS-4b to my computer so I can upgrade the firmware.

The DB25 end of the cable looks easy enough.

What about the other end?

Did you install male or female headers on the board?

What kind of connector did you put on the end of the cable?

Got any pictures?

Cheers,
Rob KA8JBY

Of course my iMac didn't have a DB25 connector (before it's recent demise, sniff, sniff), but neither does the windoz 7 box that has replaced it. My point being that there seems to be a need for migration away from the, fast becoming anachronistic, DB25?

Hi Stephen:

Yes, my little netbook doesn't have any DB25 hole either. Fortunately, I have a vintage Dell with one.

I have a MSP430 Launchpad development tool which uses a USB interface. Unfortunately, it doesn't support the MSP430F1232.

Fortunately, the MSP430F2132 is considered a "drop in" replacement (with caveats) for the older 1232 according to an application note I found (attached).

Unfortunately, according to the note:

"However there is no 28-pin DW (SOIC) package equivalent for the MSP430F12x(2) devices in the MSP430F21x2 device family. If the original design uses the 28-pin DW package, the PCB would need tobe migrated to use either the 28-pin TSSOP or the 32-pin QFN package variant of the MSP430F21x2"

Fortunately, I found a company called ACCUTEK which makes SOIC to SSOP adapters (brochure attached). I haven't investigated further.

That's as far as I've gotten.

73,
Rob

As a Mac guy, currently stumbling around in a new jungle, is a serial connector 9 pin? I don't have the ATS-4, but my ATS3-B has 7 connection points for programming so I guess 9 would work. But wouldn't Steve, or someone, have to give instructions on making/wiring the cable?

Obviously this stuff is way outside my comfort zone.

NO! The the current programming interface uses the parallel interface on the PC (normally used to drive a printer). As people have said, these are becoming rare.

Unfortunately the system also uses the interface in "raw" mode which is not usually possible with the usb to parallel interfaces available. One option that will work is to fit a parallel interface to your desktop pc. These are available as PCIe or PCI cards which fit into the expansion slots on your motherboard.

One last comment, some laptops still have parallel ports, but many of them don't work properly in raw mode.

The programming cable Steve describes in the documentation is for a parallel port. Usb to parallel converters won't work. There is a USB programmer (TI or Olimex both make one), but it costs about $100. I'll stick with parallel myself. The 7-pin header on the board is a JTAG interface. You can leave them unpopulated and use a 7 pin connector on the cable. Just push the pins in the holes then remove when done. Sometimes you may have to apply a little side pressure to ensure good connections. I have noticed that I could not get the TI software to work on my 64 bit machine, so I use my older 32-bit machine to program ATS rigs. When my old computer stops working I'll probably break down and get the USB FET programmer (MSP-FET430UIF).

Dave W7AQK

Have fun with it, Dave. It really is a nice kit. FWIW, I build on top of a large cookie sheet to hang on to the parts.

My ATS4B is having trouble on 15 and 20 mtrs. For yet unresolved reason, the current drawn is way high on these two bands even with low power out. Steve suggested that I check the soldering on U8. I reheated that one (twice) but no joy.

anyone else experiencing such???

No. I have USB programmers here. Those that do not wish to spend money on the new programmers and want to use old methods are stuck using old PC technology :0

I have serial programmers, USB programmers, and a full JTAG debugger that is USB.

No, it's not defective, it's just that two minor things which should work, don't. 1., the last used frequency isn't restored when turning the rig back on and 2, in DFE mode, the characters which are normally written on the display to remind you what each switch does, aren't.

Steve;

I'm taking a huge chance in this reply, but the only real "changes" from 98SE to today's whizz-bang OS that I've seen is to run more applications about the same time. I'm playing an "old" computer game on my XP based 'puter that did fine on 98SE, now I have only half the controls, strictly on the keyboard. With the size of memory you mention, I'd think that you might be safe, just give it a try.
Hoping that you and everyone can be spared the dizzy head and back pains of whatever bug or virus I seem to be struggling with, darn winter, though!

I've had pretty nice handling results with a sheet of the white poly foam that is used for packing. One sheet, under the resistors and caps as they come outta the carriers.. works real well.. because the parts don't bounce. In anything hard.. they rebound with revenge that is awesome to behold.. and impossible to track.
As for the low power Fred... can you get any adjustment from the coils squeezing or spreading... and the upper limit of current is... at 9v input something around 900ma. And if you find that the coils don't reach by spreading or squeezing.. how about adding or taking a turn off? At this point you're operable, now it is time to find what works in your radio.. k?

The trick now is to keep SMD parts from flying off the workbench.
Unfortunately, I know more than I wish I knew about that problem!

Dave
W7AQK

Have fun with it, Dave. It really is a nice
kit. FWIW, I build on top of a large cookie sheet to hang on to the
parts.

My ATS4B is having trouble on 15 and 20 mtrs. For
yet unresolved reason, the current drawn is way high on these two bands even
with low power out. Steve suggested that I check the soldering on
U8. I reheated that one (twice) but no joy.

anyone else experiencing such???

73, Fred - kt5x

Dale;

While I'm slowly abusing my back and legs, "arthritis pills for dinner", I'm reviewing the little desk that I used to build my last project, thinking twice about the possibilities of SMT work. With your suggestion, even just to take parts out and account for them, I'm going to raid the shipping containers for the poly foam sheets which prevent "sometimes major" damage to heavy and large items which arrive. I think I can set up a nice set of walls around the whole table top, then put a deep tray in the work area that my sister uses for large size rectangular cakes - but of course, "buy my own tray".
Eventually, as pain and cold, flu and allergies allow me to think, I'll get some four "kits" back in the packages, and prepare them for your address. Have patience, age is not kind to me, so I may simply pick on one kit while you enjoy your professional touch.

Thanks for the hint, I might even get my sister to quit the acidic remarks about "that junk on the bed". She's NOT a "rig and antenna lover or appreciates the tech mess".

Tnx, 73's

7902. Where do I find instructions on how to flash the ATS4 with the new file?

Yahoo group: AT_Sprint (2012 — 2013)

From: Johnny Matlock
Topic: 7902 Message: 7902

GM all:
I have been reviewing the latest threads about re-programming the ATS4 B.
I found the schematic for the Parallel cable, and the IAR programs on the disk.
I have the programs installed and am building the cable.
How about and overview on how to flash the chip?
Is there a folder in the files section that explains this?
Thanks
Johnny AC0BQ

> How about and overview on how to flash the chip?
> Is there a folder in the files section that explains this?

Lets start from scratch:
1. create a file folder someplace, My documents is okay place. You can name it MSP
2. down load the updated source code file ATS3B.s43 into that folder
3. From your CD, copy the file ATSB.prj (located in the MPS folder) into the folder created in step 1.

4. Instal FET_303.exe, this can be done from the CD
5. after instal is complete it will ask if you want to instal FET, leave box checked (yes, instal, that is the FET_R303u file)
6. Open IAR workbench. Programs > IAR systems > IAR ----MSP430 kickstart--- > IAR Embedded Workbench (Icon with pliers and screwdriver, 4th down in list).
7. Click on "Open file" icon in tool bar
8. Find the file ATSB.prj in the folder you moved it to and click on it.
9. A project window will open in the workspace. Open the folder named "common sources" and the ATS4B.s43 source code file name should apper. Double click on that file name and a new window with the source code should open up.
10. Plug in your programming cable to the parallel port
11. turn on the rig and connect your programming cable to the programming port on the board. No need to solder anything in. Just tilt the SIP pins at an angle to ensure a good friction fit.
12. Click on the "Debugger" icon in the tool bar. This looks like a magnifying glass on the bottom row of the tool bar on the left side of the screen.
13. C-Spy window will open and the down load should begin. A progress bar will show up and clear when the down load is complete. Close the C-Spy window when done.

If C-Spy can't find your device, an error message will come up and say "device not found or not supported". If this occurs, you might have a wiring error on your programming cable or didn't make good contact with the board.

I tried doing all this from a kit CD to an old PC running Win98 in order to remember all the steps. For some reason the project and source code files got transfered as READ ONLY, so no changes can be made to the files. That might be able to be change using the file properties settings.

Topic: 7907 Message: 7907

ECO - enginnering change order.

Problem: it was called to my attention that the Tx current for 20M was significantly higher then other bands for the same power out. Also, achiving 5W out with 12V supply was difficult.

Fix: Add one turn to L17 (was 11T now 12T). Remove one turn from L18 (was 16T now 15T).

5W is now easy to obtain with 12V supply and Tx current is now 680 ma (PA + fixed current) instead of 850 ma.

This ECO applies to all ATS-4 rigs.

>
> The programming cable Steve describes in the documentation is for a parallel port. Usb to parallel converters won't work. There is a USB programmer (TI or Olimex both make one), but it costs about $100. I'll stick with parallel myself. The 7-pin header on the board is a JTAG interface. You can leave them unpopulated and use a 7 pin connector on the cable. Just push the pins in the holes then remove when done. Sometimes you may have to apply a little side pressure to ensure good connections. I have noticed that I could not get the TI software to work on my 64 bit machine, so I use my older 32-bit machine to program ATS rigs. When my old computer stops working I'll probably break down and get the USB FET programmer (MSP-FET430UIF).

7909. Updated ATS-4b FW works great!

From: mikepenzo
Topic: 7909 Message: 7909

Thanks to Steve for posting the updated ATS-4b firmware. After struggling with a permissions issue, I finally got the IDE setup on my old Windows XP machine. I flashed the new firmware with a parallel cable I built per Steve's instructions (pictures uploaded to the photo section). I'm happy to report the DFE labels now appear as they should and the rig returns to the last frequency used after a power cycle!

My permission problem was resolved when I removed the installation CD from my CDROM drive. The embedded workbench will continue to use the path back to your CDROM drive and complain that it can't write files until you remove the CD.

Good luck,
Mike

-mike/w1mt

P = V squared / 50.

If you measure 15.0 volts peak, multiply by .707, and you get 10.6V RMS.

P = 10.6 X 10.6 / 50 = 2.25W.

Johnny,
Nope, in the picture I posted of the DB25, the narrow or short row of pins are on top and the long row is at the bottom. It's a female DB25 connector. The 220 ohm resistors are hidden by the red and black heat shrink material since I soldered them directly to the connector.
73,
Mike

Ok Mike
Thanks for the info.
I counted the pins after I emailed you, and realized that the short row is up.
I rebuilt my cable and still am getting an error that says "could not find target" I am about out of ideas!
What error did you have when you CD was in the Computer?
THanks
Johnny

> To the left or right?

It depends if your looking at the top or the bottom of the board. It is the pad closest to the edge of the board, next to the '386 audio amp.

The no device found means your cable is not wired correctly or the header pins are not making good connection to the board. I always angle them slightly to ensure good connections.

Steve

It is shown on the last page of the ATS-4b manual, and is included in all
ATS manuals since the ATS-3 series started.

7922. ATS4 FQ storage

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-09 18:07:28 UTC
From: Fred Maas
Topic: 7922 Message: 7922

Turning the rig off:

Power is turned off by clicking holding the "FN" (function) switch closed for about 3 seconds, at which time the message "OFF" will appear in

the lower left corner of the display. Release the switch and the rig will turn off. Just before turning off, the current state of the rig is stored in

memory. Keyer speed, keyer Iambic mode and the last used frequency for each band is saved. These settings are restored when the rig is

powered back on.

The radio must have done this at least once, because when I turn the radio on now, it comes up on 3.502 for 80M, 7.025 for 40M, 14.025 for 20M, ...

BUT, it sure does NOT do it every time I power off, and then power back on using the buttons.

there must be some sequence of events that I am doing sometimes and not others leading to the storage of the "last used frequency" sometimes and not others??? what would that be???

73, Fred -kt5x

7923. last freq used ... ATS4

Yahoo group: AT_Sprint (2012 — 2013)

No, looks like it only does the dip package not the smt ones that Steve uses.

Also, not sure what they mean by "value line".

I don't think so.

It's been a while since I investigated this but I think it had something to do with the LaunchPad using 2-wire SPy-Bi_Wire interface vice JTAG to program the MPU's.

This is from the TI FAQ on the LaunchPad:

1. Can other programming tools like the MSP-FET430UIF interface the MSP-EXP430G2 LaunchPad socket device?

The LaunchPad experimenter board works with any programming tool that supports the 2-wire Spy-Bi-Wire interface. Both the MSP430 USB FET (MSP-FET430UIF) and the Gang Programmer (MSP-GANG430) support these devices, but the connection must be made directly to the dedicated
Spy-Bi-Wire ports. See MSP-FET430 Flash Emulation Tool User's Guide (SLAU138) for details on
using MSP430 USB FET and the Gang Programmer for a 2-wire Spy-Bi-Wire interface. Do not try to
connect the standard JTAG connector to the MSP-EXP430G2 pinheads, as this could result in damage
to the attached hardware.

Hi Mike:

I added some photose of the cable
<http://groups.yahoo.com/group/AT_Sprint/photos/album/1029230128/pic/lis\
t> I built; the album is under my callsign KA8JBY. Since I had some
laying around, I used a snap-able machine pin SIP socket from All
Electronics
<http://www.allelectronics.com/make-a-store/item/SIP-40/40-PIN-MACHINE-P\
IN-SIP-SOCKET-SNAPPABLE/1.html> as both a plug for the cable and a
receptacle on the board. It sits slightly lower than the display
socket, so it doesn't interfere with the display.

The upload of the new firmware went smoothly. I learned I had to plug
the cable into my board first, then plug it into the computer in order
for the device to be recognized. The updated firmware works great.

Good Luck & 73,
Rob

7931. ATS4B output

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-11 07:09:16 UTC
From: r_zerr
Topic: 7781 Message: 7931

So, all of Freds' KT5X talk about checking power output has pushed me for more efforts to optimize.

I started out this evening with some large 50 ohm load resistor and a Tectronix o-scope that I have access to. As was mentioned previously, I reconfirmed some of the oddities with measuring RF, and had to play with probe settings, and automatic measurements to have things start to make some sense, but I am still not there. Things like the automated Vrms being 23-27V is somewhat telling here.

However, I did note that the 15M, and only the 15M signal was not a good, stable signal. I kicked in the FFT of this and verified that 40M, 30M, 20M, and 17M all looked great, with proper looking spectrum. 15M showed spikes around 3.2+/- MHZ, 10.6+/- MHz, as well as 21.06 MHz for the principle frequency. Comparing the lower frequencies to the magnitude of the 21 MHz component, the 3.2 MHZ was about 1/4 magnitude and the 10.6 MHZ was about 1/3 the magnitude.

Any ideas on the cause of the distortion?

-Ron

Eric,
Steve sold out of his first run of 100 ATS-4(rev b)s in 3 hours, so he kitted up another 48 for sale at http://kd1jv.qrpradio.com/ATS4/ATS4.htm
I'd go ahead and buy the latest, greatest since you don't have to swap band modules.
I bought one of these and will be building it sometime when it snows this winter.

Ed Zachery, Johnny. That photo was on top of Mt Elbert, 14,433 ft. Also just finished a "four." It worked straight away, but i struggled adjusting it. While working with it, I discovered that my ATS3B was only producing an appropriate level of RF on 20 M. Now both of them are generating at least 5 watts on all bands. I amazed at the efficiency, typically over 75%.

Hi,

Is the ATS4 assembly-only manual in the group files section dated 12/8/11 the same as the assembly section of the manual dated 1/4/12 that comes on the kit CD?

I've already printed out the group assembly-only manual and am wondering if I need to toss that and print out the assembly instructions that came on the CD.

Also - are there any errata/corrections that need to be made to the supplied manual?

If your manual is named "ATS4B_revised", then it is the current manual and the same as the assembly only manual in the files section. There is no need to print out another copy.

There is still one error in the manauls (except for those most recently shipped) for the number of turns for the 20M LPF coils. This change was posted here a week or so ago.

L17 should be 12T (was 11) and L18 should be 15T (was 16).

From: Bob Flye
Topic: 7919 Message: 7947

Greetings all,
Just received my kit Monday, first ATS kit for me. I read with interest the email below from Rob, KA8JBY on the flash cable construction. I have a couple questions. First, the manual talks about the display being difficult to remove after being inserted. If you mount the programming port on top, as shown, you have to remove the display, am I looking for trouble? Second, how often would we have a need to update the firmware?

Hi Mike:

I added some photose of the cable
<http://groups. yahoo.com/ group/AT_ Sprint/photos/ album/1029230128 /pic/lis\
t> I built; the album is under my callsign KA8JBY. Since I had some
laying around, I used a snap-able machine pin SIP socket from All
Electronics
<http://www.allelect ronics.com/ make-a-store/ item/SIP- 40/40-PIN- MACHINE-P\
IN-SIP-SOCKET- SNAPPABLE/ 1.html> as both a plug for the cable and a
receptacle on the board. It sits slightly lower than the display
socket, so it doesn't interfere with the display.

The upload of the new firmware went smoothly. I learned I had to plug
the cable into my board first, then plug it into the computer in order
for the device to be recognized. The updated firmware works great.

Good Luck & 73,
Rob
KA8JBY

I recommend you not use a header or port for the programming pins. Instead just use pins on the end on the cable. The holes are plated thru and a little side pressure will be all that is needed to ensure good connection. If your happy with the firmware you may never need to reprogram. If you program and can modify the code you may do it thousands of times. If you want any upgrades that come along you may only do it a hand full of times.

If you just got the kit, you probably have the bug free firmware. I use .025 square SIP pins for my header, which provide a reasonably snug fit into the pads, so no socket is needed and I access from the bottom of the board so the display does not have to be removed.

Unless you want to play with the firmware, you don't need to up date it at all or maybe once.

Steve,

I'll try this again... I'm planning to build the 15&17-with-no-80-meters ATS-4B version. The manual says: "The extra filter parts needed to build both the 17 and 15 meter bands will be available from kd1jv for $5.00".

Do I need to order these parts? If so, how do I go about this?

73,

Mike

7953. ATS-3B overcurrent condition

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-13 19:28:03 UTC
From: tlcfarmer@arczip.com
Topic: 7953 Message: 7953

I built my ATS-3B a long time ago, probably 3 years ago or so. I finally decided to try to debug why it won't transmit.

Most everything appears to work except transmitting. The tuning goes up and down, it receives, although not very well. I can get the freq annunciation in the headphones, direct freq input works with the paddles, battery voltage can be read correctly and annunciated. When I press a paddle to transmit into a 50 ohm dummy load, the display changes to 'E' and it never outputs from the transmitter. Pressing 'menu' resets the overcurrent state and 'E' goes out. What worked before works again. I have inspected every solder joint in the TX and BPF areas and found none are shorting or look like opens.

I do not have a scope or signal injector, just a DMM.

Can anyone suggest where I should go next to look for the problem?

Oops, left this out of the original post:

The overcurrent condition('E') on TX exists even at a power supply voltage of 6v(reported as 5.4v by the 3B). Also, compared to my IC-7000, this thing is rather deaf on RX. Doesn't this indicate a short somewhere after the power amp, near the antenna connections? With the power off, the DMM measures infinite ohms across the antenna connection pcb pads.

Thanks

Does it do this for every band?

First thing is to determine how much current it draws at idle (receive only).

Lift one side of L3 (which will disconnect the finals) and see if it still trips.

Isolating the problem is half the battle...

I only built the 40m band module, so I have not tested the others.

I lifted one side of L3 and now the 'E' does not show up and the sidetone is in the headphones. So that meant L3 had the proper connection.

It also means that it could be the 2n7000 finals or the filter board.

Still wonder what the idle current consumption is? If it's near 35ma then that's good. If it's more then you got a short somewhere that may not involve the rf amp.

Last ATS build I did I had lots of issues. All went away when I clean the flux off the boards (filter boards too). Might be worth a shot.

Okay the last of the ATS-4B's shipped today. That will be it for a while. So, what to do next?

I'm thinking of revisiting the 3B. The new AGC circuit used on the 4B can be used to replace the AGC chip used in the 3B which became unobtanium, even though the new circuit takes up a lot more space.

The other problem was the bottom adjust trimmers used on the filter boards also became obsolete. Those can be replaced by SMT trimmers, though they are three times more expensive.

What I can't decide is how many bands to make it cover. I'm tempted to go single band to simplify things and keep the cost minimual. Or going back to 4 bands, with a 20M upper limit. Limiting to 20M reduces the Rx current by a significant amount. Or did I really spoil you guys by making 5 and 6 band rigs?

Suggestions and comments welcome, but keep them reasonable!! I'd like to go back to fitting this in an Altoids tin again :)

Steve,

I'd like to see some monobanders. The cost should be less and I know when I'm in the field, I generally only use one or two bands at the most. I'd very much like to be able to shirt-pocket a rig for a single band in an altoids tin. Much fun.

Hi Steve,

Well, with the upper bands starting to take off, having it go
to 10M would be nice, OR even 6M!

For me, having 160 is a waste of time as I have no room for
an antenna but I am sure there would be those who would like it as well.

Having had a ATS3, a bit more volume and a volume control in
the rig would be a bonus. I put together that encoder dial kit that was
offered for it and I must admit it was nice having a real "knob". Call me
old fashioned. Maybe just keep the knob as a home station option would keep
the back pack folks happy due to the reduced weight.

Keep up the good work.. It is nice to see such a flourishing
cottage business as yours can still exist in this economy.

Best of Luck and DX in 2012.

Steve,
Just as a wild and crazy thought.. It might be worth considering using the Si570 rather than the AD9834 (see http://cbjohn.com/aa0zz/PPLL/DaughtercardManual.pdf). That would allow perhaps even lower current drain and much higher freq coverage. I personally LOVE the fact that you supply source code with your kits (thank you, thank you, thank you!) I am aspiring to dig into it and add some flexability to it's keyer (like weight etc). As another wish, I liked the original ATS3 ability to go wideband via those solid state relays.

I'm guessing that 15M was the current hog, how about 17M as the highest band?

I liked the interchangeable band modules - you can carry as many or as
few as you want/need.

> Suggestions and comments welcome, but keep them reasonable!! I'd like to go
> back to fitting this in an Altoids tin again :)

One thing I'd like to see would be the UART pins brought out to a
header, it could be used for loading and saving the memories and
calibration data and also maybe for doing data modes from a smart
phone or tablet.

Also, on the software side, how about support for the new "Opera" data
mode, it's starting to be used on 30m as well as on the LF bands and
doesn't need audio modulation, just Tx keying.

First off, Steve, I LOVE both the ATS3B which did 40 mtn peaks with me last summer, and I am loving the ATS4B which is much more usable if changing frequencies much, a lot in the three more ounces.

What would I like???

... batteries are so small and light now. I have been intrigued by the Class E amplifier I saw one college group was experimenting with, had about three parts, the tank was actually etched into the PC board. But it was 200 watts ...

I keep wondering about ... a 20 watt class E, 20 mtr only, boots for the ATS family of rigs...

My seven ounce 2.2 AH LiPO would power it for hours. Two doublings, two S-units, much simpler than carrying and erecting a five element beam, ... RCA jacks on either end, direct plug in to the ATS on one end, a mini-tuner on the other.

(Wasn't there going to be some sort of PSK31 add-on for the ATS4B ???)

73, Fred - kt5x

Subject: [AT_Sprint] What to do next?

First off, Steve, I LOVE both the ATS3B which did 40 mtn peaks with me last summer, and I am loving the ATS4B which is much more usable if changing frequencies much, a lot in the three more ounces.

What would I like???

... batteries are so small and light now. I have been intrigued by the Class E amplifier I saw one college group was experimenting with, had about three parts, the tank was actually etched into the PC board. But it was 200 watts ...

I keep wondering about ... a 20 watt class E, 20 mtr only, boots for the ATS family of rigs...

My seven ounce 2.2 AH LiPO would power it for hours. Two doublings, two S-units, much simpler than carrying and erecting a five element beam, ... RCA jacks on either end, direct plug in to the ATS on one end, a mini-tuner on the other.

(Wasn't there going to be some sort of PSK31 add-on for the ATS4B ???)

73, Fred - kt5x

W5YA / qrp

WS0TA on mtn peaks

Okay the last of the ATS-4B's shipped today. That will be it for a while. So, what to do next?

I'm thinking of revisiting the 3B. The new AGC circuit used on the 4B can be used to replace the AGC chip used in the 3B which became unobtanium, even though the new circuit takes up a lot more space.

The other problem was the bottom adjust trimmers used on the filter boards also became obsolete. Those can be replaced by SMT trimmers, though they are

three times more expensive.

What I can't decide is how many bands to make it cover. I'm tempted to go single band to simplify things and keep the cost minimual. Or going back to 4 bands, with a 20M upper limit. Limiting to 20M reduces the Rx current by a significant amount. Or did I really spoil you guys by making 5 and 6 band rigs?

Suggestions and comments welcome, but keep them reasonable!! I'd like to go back to fitting this in an Altoids tin again :)

72, Steve KD1JV

7972. Last Minute Reminder: MIQRP Club January CW Contest

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-13 23:01:29 UTC
From: Hank Greeb
Topic: 7972 Message: 7972

Last Minute Reminder. The Michigan QRP Club January CW Contest will be held beginning 1200Z Saturday 14 January 2012 and ending 2359Z Sunday, 15 January 2012. Yup, 36 hours of possible contacts. Contacts between stations all over the world - you needn't be a Michigan QRP Club member - just an interest in operating low power.
For full details see http://www.miqrp.org/contest.html

Note that this contest is held concurrent with the North American QSO Party. This is a "full blown" contest - quite a few station on, so "picking out signals" and making contacts is a breeze! I've found that you can usually convince NAQP ops to give you the info needed for the MiQRP contest in exchange for your info for the NAQP. See
http://www.ncjweb.com/naqprules.php
for details of this contest.

There are two other concurrent contests being held on the same weekend the Peace Messenger Cities contest
See http://tinyurl.com/2afb3f7 for rules
There were no results posted for 2011, so whether this contest is still viable is in question.

Also the "Lions Hunting in the Air" contest is advertised,
See: http://lionshuntingintheair.lionwap.org/
The last info on this contest is dated 2010, so it may or may not exist

Hi to all:

About revisiting the 3B, I need to say that the keyer programming may be check. I always found that the key response is different than all my other keyers. By some unknown reason I miss the correct morse creation specially when going from di to da. I can transmit with it, but is always harder. The paddle does not response the same way like my others keyers. The ATS4 is easer on mode B than the 3B. Hard to explain, but something may be different on this.

The size matter, but the box need to protect well the radio, specially when portable. For this the ATS4 box is better than the Altoid one. Not exactly pocket size but more secure.

AGC improvement, welcome!

I have a lot of radio stuff but the 3B is one of my prize possessions, so I would like to see something similar to it or a revision of it. I really like the small band boards, as has already been pointed out by others. I take just what I need and the rest of the bands stay home. Five or six bands are important to me (stopping at 15), as it gives interesting day/night options and different operating challenges. I am totally CW oriented.

The Altoids tin size is perfect. The identical form factor implemented as a die cast or machined enclosure would rock. My only concern with a Real Altoids Tin is that it's not so strong when in the field. I stepped on mine once.

I personally could do without the single digit LED, with maybe some smt LEDS instead to indicate important status states or modes.

I, too, wish the power connector was bigger. It's very fragile, and I have pulled the center out of mine roughing around.

The 4 Series is an amazing radio to be sure, but in some ways I really think you hit the sweet spot with the 3B.

Steve- Thanks for the super kits. For the new ats3, I suggest 80 and 40 meters. Altoid size is OK, but I would like to see a more robust enclosure as an option.

Today my wife and I were privileged to attend a lecture by Jennifer Pharr Davis at Calvin College in Grand Rapids, Michigan during their annual "January Series" (See http://www.calvin.edu/january for details of the entire series.) In case you've never heard of her, she is a "trail walker extraordinaire." One of her greatest accomplishments was to set a new record for traversing the 2181 miles of the Appalachian Trail for both men and women. She made this trek in 2011. aided by her husband who provided ground support, moral support, and logistical support. She made it in "46 grueling days" (in her own words.) She had made two other trips, the first in 2004, which was her very first back packing trip, and set a new record for female trekkers of 56 days a few years later.

She has been named "Adventurer of the Year" for this year by National Geographic Society. She has written a book, "Becoming Odessa." Don't know what else I can say.

Keep an eye out for her talks, she's a very good, inspirational and motivational speaker.

There is a more robust enclosure. It's offered by American Morse? It's
die cast aluminium, slightly larger than an Altoids Tin, a bit heavier,
but considerably more rugged. See http://americanmorse.com/aa1.htm
It's currently out of stock, but perhaps we could encourage some
production if there's enough interest.

For me, you can take out the keying feature, but figure out a way to
generate RF @ 28 MHz without consuming more power. Or, figure a single
band unit with VFO for 28 MHz.

My wish list:
Altoids size.
Wide filter mode (yes, I have used ATS3 in cross-mode QSOs).
Include the op-amp needed for digital input (my smartphone can't drive the ATS3b directly) -- perhaps a separate jack.
Include bands the 3b doesn't: 160 & 60, plus 10 & 12 meters -- needs SI570?
Configurable frequency memories, especially if you include 60m.
Don't need the 1-digit display but it's cute.

A feature of the earlier ATS3 rigs was the ability to switch out the crystal filter in receive to allow SSB reception.

I'm not sure how many folks used that cross mode feature, but here in British Columbia the BC Emergency Net meets on 3729 most evenings. I have checked in cross mode with my Icom, but having the ability on a 3B would make "the world's greatest little 6 band rig" even more useful for emergency use.

I would be disappointed if you changed the form factor for the 3B; is has to go in a mint tin.

I like the single digit display and I keep the CW turned off. I also like the plug in modules; an easy way to have so many bands.

~~~~~~~~~~~
If you wanted to design a *single band rig* that I might buy (I already have an ATS3-B) it should be CW/SSB in the same mint tin. Maybe you could plug a 'skype' headset into the paddle jack? 80M would be my choice, but if you had a few models I might buy another band as well. Of course 6 bands, with the plug in band modules would be the best for this dual mode rig.

Hi Steve,

I really like the idea of a 6m rig in a similar form factor to the ats3 rigs. Maybe CW and sideband? Buckeye Shape Form makes some really slick little extrusions that would make great chassis that double as heat sinks. Thanks for all the great work that you do.

Regards,

Andrew

Steve and All,

I'll put in my 2 cents worth about how many bands. Personally, I think having 5 or 6 bands is a luxury--nice, but not all that necessary. Your timing on doing that was pretty good, considering the fact that a couple of the higher bands open up a bit more, but later we will be back to a 20 meter max with some 17 openings. Personally, I don't care much about 80 meters either--used to love that band, but that was eons ago. For a trail radio, 80 meter antennas are tough to deal with anyway. So, I vote for 3 bands at least, and maybe a 4th.

I hesitate to say anything critical about you just going back to monobanders, but I've already got a ton of those. Of course, I don't know what you have in mind, and it might be really exciting. So, I won't say much else about that.

The folks who are into digital, like PSK31, JT65, etc., are apt to have a wish list.

I've never been disappointed in anything you came up with, so whatever comes next will probably be a winner. I do think you should seriously consider another batch of ATS-4B's though, since I strongly suspect there are still a fair number of folks out there who were left out. Maybe a little hiatus is in order, to let a few more of these get built and operating, and for a few fence sitters to screw up their courage to attack this kind of project. I just hope I don't goof mine up! Hi. I bet if you took 50 of them to Dayton you would sell them all!

Sunday night is the January 2012 edition of the Run For The Bacon. That friendly lil' ol' QRP Sprint sponsored by your friends at the Flying Pigs QRP Amateur Radio Club International. Join us for a spell to have some fun and to say "Hi" to friends, old and new.

The time is the same as always:

East coast - 9:00 to 11:00 PM local time
Midwest - 8:00 to 10:00 PM local time
Rockies - 7:00 to 9:00 PM local time
West coast - 6:00 to 8:00 PM local time

The rules are at:

http://fpqrp.org/pigrun/

Something new for the New Year - make sure to use the Autolog feature to enter your score after the Sprint. This Wednesday evening, I will take all the callsigns that enter their score into the Autolog and will put them in a hat. A random call will be drawn and the lucky winner will receive a Flying Pigs wristwatch. You don't have to be the highest score to win - but you do have to enter the Sprint to win!

Yep. She said that "eating 6500 calories per day on her latest trek on the Trail was a chore and a challenge." She needed that many calories because of the amount of energy it took to do almost 50 miles per day along the trail. She also said that in her formative years she was sometimes concerned that while other girls were building chests, her body was building thigh muscles. But, her enthusiasm for "walking the trails" in the US and other parts of the world was obvious and probably contagious. As I said before, if you get a chance to hear one of her presentations, go for it!

I know I won't ever cover 2184 miles of walking in any one year, much less in a summer season.

Thanks for the ideas.

First, the Si570 suggestion. Couple of problems with that. 1, it only goes down to 10 MHz and 2, it draws over 100 ma. That's twice the total receiver current of the -4's. Plus it's pretty expensive, hard to get and a pain to program.

20W class E amp - no. Too touchy and I don't want that responsability.

Single/multi ? I guess it only makes sense to stick with multi.

I've already removed the phone and power jack from the board to make room. I can use the larger power plug now used with the 4's. This unfortunately requires notching the edge of the lid a little to clear the mounting nut.

I'm guessing that 15M was the current hog, how about 17M as the highest band?

I can use a 50 MHz clock for up to 20, any higher and it needs to be 60 MHz. That extra 10 MHz of clock speed causes the big increase in current.

Altoids vs Custom case

The Altoids tin has proven it's self as a rugged enough case. At least one 3B I know of was carried in a backpack for most, if not all, the Appalachian Trail and a number of them have been carried for lesser, but still very impressive distances.

Another advatage of the Altoids tin is the great job many have done to customize thier case.

I can't add a volume control to an Altoids sized rig, there just isn't enough room. I can however, make the minimum level at which the AGC kicks in adjustable, so one can set the max volume to thier perticular thrushold of pain. And of course, there are volume controls which can be added in line with headphones available.

I love my ATS3, and it's had plenty of use, both /P and in the shack.

IMHO the Altoids is the perfect enclosure for it.

I've replaced the finals 4 times due to between the ears tuning problems. How about automatically switching in a resistor or a string of diodes, or lower voltage regulator when in the Tune position?

I like 160, but it might be difficult getting 160m windings on a T30-2.

Oh, the finals need replacing agn :o(BUT it's a really great /P rig and I'll continue to take it along.

Back to the bench, Winter's too valuable to waste.
I love this radio stuff !

Consider a SWR bridge and a feedback circuit which would reduce the drive and/or power output so the finals wouldn't be damaged. This has been the "standard" for many (most?) commercial rigs since the 1980's.

Whether this would be possible with a simple rig like the AT-Sprint is a question beyond my technical understanding.

The easiest thing to do would be to use 9 VDC and ~3 watts out, instead of trying to get another 2 dB or so @ 12 VDC and ~ 5 watts. That's what I've done, and have never had a problem blowing finals.

Hi Steve,

For my 2 cents worth... how about including a "tune-up" ciruit... like a 5 ohm resistor, with a shorting switch... for lower power and for tuneups.

Or.. a current limit for the finals... settable, in software... or with a button for "tuneup" and lower power/longer battery life.

Second.. (you didn't really think I'd let you off with just one did you?) how about a 160 - 80-6o-40 and 20 all cw. If not nice lose 20, also the other end... 40-30-20-17-15 or trade 17 for 10 with 40-30-20-15-10. All cw.

psk encode/decode. input with paddle, pretty cool.

I really enjoy the boxes the at4 comes with. An option, of transparent colors? Applied by owner, not you.

I'm thinkin of washing one in Simple Green... anodizing...??

An add on BLT type tuner... plug in..attach to.. stack on... or cable to... with the Tayloe bridge.

But getting that to play on 160 almost dictates a single band effort. Or Plug and play coils/caps.

ok.. I'll stop, for now.

Isn't this fun?

Thanks to the tip in the construction manual about loosening the socket before inserting the display, I've had no problem with removal/re-installation.

I don't know anything about programming microprocessors, with the exception of Arduino, but I'm trying to learn. Depending on my progress, I may be hooking up the cable again. Or, I may never touch it. Time will tell.

The pins in my original plug turned out to be too big for the existing holes, hence my approach.

Cheers,
Rob

Steve,

Thanks for asking, glad to see you are up for another project!

What I'd like to see in a Trail Friendly Radio...

Low power operation is necessary to minimize battery consumption so CW is definitely preferred.

On the trail a radio by itself is pretty useless since you are not likely to have an ideal antenna, so an integrated antenna tuner would go a long way towards making this a Trail Friendly Radio System.

Having to carry antenna wire is bad enough, I certainly don't want to carry feed line as well...I prefer losing the feed line and using EFHW (End Fed Half Wave). The other benefit of EFHW is that you only have to string one significant antenna wire, not two...better for simply tossing over the cliff or using with a balloon/kite/single tree setup, and there is just one wire needing to exit the tent/shelter. A EFHW tuner is needed to allow this.

Reasonably reliable communication within a 300 mile radius is more important to me on the trail than dx, so being able to operate NVIS (Near Vertical Incidence Skywave) is critical...which means 40 or 80 during the day and 80 or 160 during the night (but 160 is too much antenna!). An added trail bonus is that NVIS is compatible with operating in a valley and using an antenna hastily strung near the ground.

No point in carrying a broken radio...so the power/antenna/earphone/key connectors need to be solid and reliable.

On the trail it is best to consolidate your backpacking energy needs to AA batteries, and therefore that is what I'd expect to use. I'm thinking 8 AA lithium batteries would be reasonable...more than that is too bulky/heavy/costly and less will require compromising on power output. For more solid 5w performance I'd be willing to sacrifice operation at lower input voltages (if that helps).

For these reasons I'd like to see a 2-tin radio...CW on 40 and 80 (minimum) with solid 5w capability in one tin, and a EFHW tuner in the other tin secured back-to-back with the first tin. Integrated SWR meter/detector, with extra points awarded for making the tuner auto-tuning. The radio should be reasonably ruggedized in terms of connectors, controls, ESD (with tins closed), and load impedence. Full CW band operation and excellent filtering are strongly desired. There needs to be a 50ohm antenna option for operating at home, but this doesn't need to run through the tuner if the tuner is intended for EFHW.

Power requirements must be compatible with being directly powered by 8 lithium AA batteries ("13.8Vdc", not 12Vdc).

Same problem exists after building and testing the 80m band module board. The rx is mostly deaf, and the tx goes 'E' immediately upon closing a paddle. With the 80m band module, I used a Drake R8A to find a on going QSO which I then tried to tune to with the 3B. The 3B could not hear it. I accidentally bumped a paddle, and there was a continuous tone on the R8A that drown out the QSO completely. The LED digit on the 3B was 'E' again, and the menu key reset the 'E', at which time the tone went away. I went to a vacant frequency and repeated this with both paddles. I also found out there was no output registered on my well working WM-2 wattmeter. The power supply was set at 10v.

All this leads me to believe that the problem is in the common rx and tx components near the power amp and band module. The problem exists with either the 80m or 40m band module installed.

Any help anyone can provide would be very welcome and appreciated.

One common area is in the antenna connection. I would take a look at L4, C59 and D3 to see if there are any possible bridges. I would check the polarity of D3 and I would put a hot iron to both sides of C59 and L4. Those three components are common to receive and transmit. If C59 or L4 is not properly soldered, or D3 is reversed, then it seems you might get the results you mentioned.

Anyway it's a place to start.

From: Vojtech
Topic: 7962 Message: 8001

Hi Steve.

I am sure there is a demand for the Altoids size transceiver, I know one HAM, who prefers the smaller factor over the ATS-4. I have to admit I got rid of most of my HAM equipment, but I keep the ATS-3b.

In regard to the band modules, I would be happy with 4 band modules as a standard and couple of more as a separate option. To be able to buy just the printed board for an additional band module would be a big help. Having a chance to buy a band module board will be helpful for those who lost some.

> Consider a SWR bridge and a feedback circuit which would reduce the drive and/or power output so the finals wouldn't be damaged. This has been the "standard" for many (most?) commercial rigs since the 1980's.

> For my 2 cents worth... how about including a "tune-up" ciruit... like a 5 ohm resistor, with a shorting switch... for lower power and for tuneups.
Or.. a current limit for the finals... settable, in software... or with a button for "tuneup" and lower power/longer battery life.

I think those are good ideas. Something like an overcurrent detector like in the original ATS-3 connected with a circuit adjusting the bias of the CW keying FET could do the job. Maybe the bias could be driven by PWM from the software to control the output power by software?

Regarding the SSB reception, my experience with my modded ATS-3b is, the receiver IF and audio chain is quite noisy. When open up for SSB, it is noticable. I don't think quality of the SSB reception it is worth the complexity. Likely the most noise is produced by the 2nd NE62 mixer and Elecraft KX1 (and the Chinese copy of it) add a current follower after the IF filter and before the 2nd mixer likely to lower the noise and for impedance matching of the filter.

Audio volume could be nicely controlled by digital pot, like in my modded ATS-3b. Microchip has some for reasonable price. Just put them into the feedback of an op amp.

I always was for an encoder for tuning. The encoder could be used for digital volume control. A cheap encoder with removed spring has a pretty fine tuning step and is small.

I would recommend to go with the modern MSP430 with fine pitched leads and to provide MSP430 lauchpad kit with it. For $4.30 it is dirt cheap and allows everyone to program his radio without having to dig for an old PC with parallel port. This would allow to go with a modern MSP430 chip with more memory to implement more SW features or with more input / output pins. I think the programmer part of the kit has even an USB to serial converter, which could be used for communication with the radio, like programming of the CW memories and frequency memories. The bigger chip could do logging, audio recording, you name it.

I might be wrong, but as I have understood it, the ATS-3 relied on the AN6123MS to take care of both the manual volume control and the AGC. This chip is no longer available. This meant that a new construction was needed which had to include a manual volume control. The ATS-4 was a direct result of the feedback Steve got from this list during the construction process.

I think that the ATS-4 was a vast improvement over the ATS-3. Extensive use in the field during a lot of SOTA and SMFF activity have confirmed this impression.

We should not forget that the ATS series spring from Steve?s own needs during his tours along the Appalachian trail. Thus it is constructed as a trail friendly radio for portable operations when you have to carry all your equipment on your back during extended trips away from civilization. It is not supposed to be a toy to play around with in your home shack or to take to some park bench not far away from your car.

Out in the bush you are not very interested in working DX. More important is contacts up to a distance of 1500 km. The radio might also be needed in case of emergency. Primarily you need 80, 40 and 30 meters. 20 meters is not needed for us in Europe, but perhaps it is for you over on the other side of the Big Pond. 17 and 15 meters are not needed at all!

I belong to the fraction that are against including a antenna tuner in the same box as the tranceiver. Working with an EFHW antenna I have found that it is better to have one or two meters of RG-174 between the tranceiver and the tuner. It gives you more options both where to sit down and how/where to put up your antenna.

When you look around, there are actually not that many rigs that fit the same bill as the ATS-4. The only other I can think of is the Youkits HB-1B. However, it is a bit bigger than the ATS-4. It is also more expensive and it does not have a message memory for the CW keyer, something I have found to be almost a must when working SOTA or SMFF.

As for me, I wish Steve would continue to develop the ATS series along the ATS-4 concept. Thus I hope that the ATS-4, or something similar, will be available to us in the future at regular intervals. If Steve gets tired of doing so he perhaps could hand it over to Hendricks QRP Kits to produce them...

Hi Steve, fellow hams,

Thanks for the great job you do around the ATS serie, Steve.
ATS-3, ATS-4 and even KX-3 or FT-817 alike others different services for different prices.

I was thinking about buying an ATS-4 for last christmas but the economic slowdown here forced me to cut in my budget.
I still expect to buy me a portable rig for my birthday in April.

About the form factor, this my own thoughts.
For me, going portable must be with a really portable rig.
ATS-3 is perhaps a little bit "too small", I mean the package not as sturdy as you can expect for something to go in the wild.
ATS-4 is at the upper range but ok since it offers a lot more convenient features.
KX-3 and FT-817 are ok since they can be "self contained" with batteries and ATU... but perhaps a little bit too big for being really convenient.

About the features :
- performance like ATS-4 are great, no need for better,
- CW only is ok for me,
- 5-10W power out is ok. More will draw batteries too much for portable.
- 1 band is ok but not enough. 4 band is ok but perhaps too much...
in fact I'd like 2 bands (plugable filters are ok), one for night (40m or 30m) and one for day (20, 17 or 15m). 160m or 80m are out of consideration for me in portable conditions. 17 and 15m are good compromises band for daytime and aerial size.

About the cost... Well 240 USD is in the top of the range I can afford for a rig I will use 3 or 4 times a year. The ATS-4 was a great deal without doubt, but if a monoband rig without display and casing allow to significantly cut prices, for me it will be the best choice.

I vote for a revised ATS-3.

Attachments: 1 described; binary payloads are missing from this source WARC

There is a LOT of additional user functionality in the ATS4B that isn't there in the ATS3B at the cost of only three ounces.

My #1 wish in the ATS4B, at least, so far, is Anderson Powerpole DC jack. Such could slide into a slot and slide out again, not need to be unwired to service the radio.

I tend to stay on one FQ and call CQ on SOTA's, and I tend to do the same with the ATS3B. If I am out for longer, trying to tune about, operate in a QRP to the Field sort of activity, the ATS4B wins hands down.

Probably many folks use a tree to support an antenna. I don't because so many of my peaks are either desret peaks, no tres, or so high, over 12,000 ft, as to be above treeline. That caused me to design a system using a 20 ft crappie pole indepedent of andy site support.

I have designed an approach to this where the radio doesn't lay on the ground, at all, ever. My desk is the pole. I connect the radio to the pole and sit next to the pole. to do this simply, I have replaced the screws for the top with 1/4 inch stand-offs, see photo. I offer this as I think sharing ideas has a way of leading to even better modifications!

73, Fred - kt5x
aka WS0TA

P.S. I use 3S LiPO batteries. The majority of the cahrge is between 11.1 and 11.6 volts. I am getting over five watts out at that voltage at modest current drain (efficiency in the range of 75 to 80%).

I might be wrong, but as I have understood it, the ATS-3 relied on the AN6123MS to take care of both the manual volume control and the AGC. This chip is no longer available. This meant that a new construction was needed which had to include a manual volume control. The ATS-4 was a direct result of the feedback Steve got from this list during the construction process.
I think that the ATS-4 was a vast improvement over the ATS-3. Extensive use in the field during a lot of SOTA and SMFF activity have confirmed this impression.

We should not forget that the ATS series spring from Steve´s own needs during his tours along the Appalachian trail. Thus it is constructed as a trail friendly radio for portable operations when you have to carry all your equipment on your back during extended trips away from civilization. It is not supposed to be a toy to play around with in your home shack or to take to some park bench not far away from your car.

Out in the bush you are not very interested in working DX. More important is contacts up to a distance of 1500 km. The radio might also be needed in case of emergency. Primarily you need 80, 40 and 30 meters. 20 meters is not needed for us in Europe, but perhaps it is for you over on the other side of the Big Pond. 17 and 15 meters are not needed at all!

I belong to the fraction that are against including a antenna tuner in the same box as the tranceiver. Working with an EFHW antenna I have found that it is better to have one or two meters of RG-174 between the tranceiver and the tuner. It gives you more options both where to sit down and how/where to put up your antenna.

When you look around, there are actually not that many rigs that fit the same bill as the ATS-4. The only other I can think of is the Youkits HB-1B. However, it is a bit bigger than the ATS-4. It is also more expensive and it does not have a message memory for the CW keyer, something I have found to be almost a must when working SOTA or SMFF.

As for me, I wish Steve would continue to develop the ATS series along the ATS-4 concept. Thus I hope that the ATS-4, or something similar, will be available to us in the future at regular intervals. If Steve gets tired of doing so he perhaps could hand it over to Hendricks QRP Kits to produce them...

I'm going to have to stop thinking about this.... or Steve will go over the edge trying to keep up with all of it.

Thinking about inside the radio, the rit or xit, if they could be tuned, then returned to easily... Set the tx over there... listen here... check the tx freq, return to the rx freq...

do it again.. move the tx, without affecting the rx.. check either one for signals... that flexibility is very nice.

The narrow filtering is wonderful, but at times it would be good to widen out the rx... then narrow it back....

The adjustable speed keyer is wonderful.

ok.. now I'll stop. ... no promises for how long tho...

Steve, you do wonderful design work, it is amazing, and great to work on your stuff.

Have a great day,

Hmmm, dual VFO A/B, split mode. That's a great idea, if only someone would write that. :)

Seriously, if you haven't checked out my firmware it might be worth it.

I really like Vojtech's idea of using one of the newer TI MSP430 so that the $4.30 board could be used. Only need 2 lines to program then.

Well, the ATS-3B has been perfect for me, especially for taking on trips. I like the Altoids size, and yes you spoiled me with a multi-band rig. Using a 9V battery for power is a real plus.

Too bad the higher frequencies cause such design problems, a two or three-band radio with 20M as the lowest frequency would attract me. Like 20, and 17, 15 or 10.

It sounds like on or more of the 2N7000's are shorted out. Put an ohm meter across them (drain -source) and the meter reads anything but on an open, remove them. Contact me direct for replacements.

I recall on my first 600 miles (1000 km) I lost something like 25 lbs (and I didn't need to lose any!) After my 6-artery bypass at that point, and three hundred days to recover, I went back and finished the other 1600 miles (2500 km). I had regained the 25 pounds in the interim lost 35 lbs on the second leg of the hike. Even though it is just walking, it burns huge amounts of calories. I just couldn't replace what I was burning and I speculated in my book that if I had two more weeks to go, I probably wouldn't have finished because I would have had to take some time off, just to sit and eat for a week or two.
I was traveling way slower than Jennifer, it took me a total of 180 days. I even had the pleasure of hiking with Steve for a few days in Maine.
Of course going slowly meant time to use the ATS3a often. The ATS is perfect for that application (long distance hikes) but not really a home station rig, at least in my opinion. Home stations should be convenient and comfortable to use. I've never understood why people want to build QRP equipment so small? Yes, in a backpack that makes sense, but in a home station, I like having easy to see knobs, readouts and connectors. I like frequency readout displays and volume controls. Form should fit function and tiny in the home station just doesn't work for me. I love my HW-9 because it suits a home station environment. I love the ATS-3A because it is perfect for that environment (The AT!)
I just returned from carrying the ATS on my hike across Spain on the Camino de Santiago, 500 miles (800 km). (Another book? Yep, title: A FEW MORE ZEROES, available this spring) Because of the six-hour time differential I didn't work too many US stations, I think it was four, but worked a bunch of Europeans and Asians. The ATS is a real work horse. I used a set of six Energizer disposable lithiums and they're still running, months later. Nice job Steve.

Just one more thing to think about...

When you (Steve) designed the first ATS rigs we didn't have the same battery technology as we have today. So current consumption was a bigger factor.

Today with Lithium battery technology it isn't such a big factor in my opinion. The best PP3 size batteries are at least twice the capacity of their equivalents from 5 years ago. On the SOTA reflector we have two people having a competition to see how many QSOs they can manage from a single 9v PP3. The record so far is over 500! Admittedly it's a rock bound single band rig with less that 0.5W output, but it just goes to show what is possible.

What I'm saying is that you shouldn't worry too much about a few extra milliamps if it gives you another band/feature/bell/whistle.

Consider going to something like the MSP430F5172 in the TSSOP38. Gives 32K of flash, 2k or SRAM, a 10 bit A2D and a 32x32 multiplier. Add a 4 pin connector for a UART at CMOS signal levels (with power). I'm thinking a better psk31 demodulator than http://groups.yahoo.com/group/AT_Sprint/files/KE7ER/pskuc.c in MSP430 firmware, options for an lcd display, chording keyboard, and/or rotary encoder on the UART, enough flash for recording the last qso, ... A larger MSP430 would make all kinds of experimentation much easier without hardware mods to the rig.

Hi,

I agree with the Si570. It's an interesting chip (that can often go below 5MHz) and not so expensive if you compare all the parts to build a DDS having similar performances and frequency range.
However, it is a pain to program and it is really different from the way you choose. For the ATS purpose, sticking with a DDS is the best choice. No gain to expect from the Si570.

If it is a great power consumption difference between 20m and 15m, then, my personal choice would be a twin bander 30m/20m. This could also allow some LPF parts sharing perhaps.

Altoids box is a great choice for you in North America. However, in many parts of the World I know (France, Spain, Viet-Nam...) they are not so common. Ok I can wait for some guests or relatives to come and bring me one...
That said, the form factor by itself is ok and open the way to many other solutions. This size of box is easier to find than other sizes...

For connectors and controls, keep it simple. Working portable QRP you don't need the same ergonomic as contesting. The gain for "handling and installation" is more important than for operating.

73,
Yan - XV4Y.

I've been following this thread and even contributing to it, but today I had this thought.

How many of us, back before the first ATS, would have been able to come up with even a FEW of the features that Steve put into this rig? For sure, not me.

So, I for one am going to vote that we give Steve some space/time to amaze us again. I'm sure he values the inputs he has received, but I also suspect that, given the space/time, he can produce something that blow our minds. Again.

I'd like to see a "SOTA special" version of the ATS3.

The thing that's always impressed me about the ATS3 is how sturdy it is. On SOTA outings I can just toss it in a bag with the rest of my portable stuff, throw the bag in my pack, and not worry about it being damaged if I bang the pack into trees or rocks along the trail, rummage through the pack looking for things, sling the pack to the ground at rest stops, drop the ATS3 off a rock ledge when setting up, sit on it a bit when squirming around in a tight operating position, and so forth.

I also have a KX1 and, if I take it, I always feel like I have to baby it along compared to the ATS3 so the ATS3 goes on all but the easiest SOTA trips.

Part of that sturdiness comes from its super light weight, but mostly it comes from the total lack of delicate, protruding controls and the simple, rugged and cheap Altoids tin enclosure ☐ who cares if the tin gets banged/scratched up, as long as it protects the ATS3 board. If/when it gets too ratty looking just buy another one, drill a few holes and you're back in business.

The only problems I've ever had with my ATS3 have centered on the band module connector. Not a lot of problems over the years but all caused by that interface. In my experience, for SOTA outings of any difficulty, multi-band capability is really not much use so a single band unit that eliminates the band module connector would be fine with me. Also, fancy tuning capabilities aren't needed since you spend most of the time calling CQ on a single frequency.

So, what I'd like to see is a simple, rugged, single band unit that fits in an Altoid tin, with the same great receiver, and rugged finals that put out as much power as practical.

NAQCC Sprint Wednesday night!

Our January sprint is this coming Wednesday evening local time (Jan 18, EST - 8:30-10:30PM, CST - 7:30-9:30PM, MST - 6:30-8:30PM, PST - 5:30-7:30PM), which translates as Thursday Jan 19, 0130-0330Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201201.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX. A Certificate for top score in the GAIN antenna category. Finally there is one more award - a certificate to the highest score from a first-time participant.

Prizes: A prize of a set of bug/paddle handles or a K1/K2 knob insert donated by master woodworker Gregg WB8LZG is awarded for each sprint to the winner of a random drawing among all participants. Previous winners are not eligible.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 5,840+ members in: All 50 States - 9 VE Provinces - 90 Countries. Just sign up on the NAQCC website (http://naqcc.info/) and you will receive a handsome certificate, with your membership number which is good for life. A great way to start the New Year!!

Come join us and have a real good time!

72/73 de Dave VA3RJ
NAQCC #0004

Hi Steve.

I got a crazy idea. Let's get away from the Superhetodnyne and build a phasing receiver using two NE612s. I built something similar for 80m and the receiver performs favorably on low bands compared to the NE612 based superhet like ATS or KX1, because there is no ladder filter to ring. The receiver sounds much comforting on 80m and 40m than the ATS you would not believe it. All filtering is performed in audio chain.

http://kufr.cz/~ok1iak/HAM/DOB80/index.php3

The problem is, the approach needs quadrature VFO. But when going with pluggable boards, the phasing can be done at the band module with a simple RC circuit! Now you have a challenge to build something nobody done yet, a multiband phasing TRX with cheap DDS running not at 4x the mixing frequency.

The phasing receiver usually has relatively poor opposite side band suppression, likely around 40dB. All filtering is done in baseband. Dan Tayloe issued great presentations on audio filtering for the DC receivers:

http://www.norcalqrp.org/files/PacificonNC2030Presentation.pdf
http://www.norcalqrp.org/files%5CReceiver_Audio_Filtering.pdf

I have one of the NC2030's and I was never able to get it to work very well. Mine has nearly no sideband rejection, no matter how hard I tried. Getting the phase shift just right is easier said then done.

To do it right you really need a X4 VFO and DSP filtering and signal processing. I'm reasonably good at flipping ports on and off and doing simple math, but when it comes to DSP programming, that's still way over my head.

Dang.. That is not good news since I am still building my Norcal 2030 from a few years ago (I just recently collected all the parts). I hope mine works correctly at some point.

I have seen at least one report of a success story from Don Huff where he built a Norcal Tayloe based detector for his R2Pro and he claims getting 60db opposite sideband suppression using an AD9854 IQ vfo (with compression trimmers on the output to tweak the RF phase). (as per his pdf project summary at http://cbjohn.com/aa0zz/IQProUsers/W6JL/W6JL.pdf)

8029. ATS4A cw memory keying spacing fixed

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-17 02:24:34 UTC
From: K
Topic: 8029 Message: 8029

As I mentioned in an earlier message, I didn't like the spacing when using the keyer memories of my ATS4A. I modified the firmware slightly to make standard spacing. While I was at it, I changed the upper transmit limit on 15m to 21450 KHz -- not that I expect to operate up there. I then followed Steve's directions and flashed the firmware with no trouble. I am happy with the way the keyer messages sound now.

In case anyone else wants to do this, my 3 tiny changes are shown below (the < lines are the originals, and the > lines are their replacements)

Thanks again to Steve for providing the firmware source and the directions to modify it.

> I have one of the NC2030's and I was never able to get it to work very well.
> Mine has nearly no sideband rejection, no matter how hard I tried.

I had the same issue with the DOB80 transceiver, which is a much simpler design, but works on the same principles as the NorCal 2030. There was a typo in the schematic, which made one of the two IQ audio signals before summation much louder. After I fixed the issue, the opposite sideband suppression measured rigorously by my ears came from "no difference" to "barely audible at the other sideband when extremely loud on the correct sideband".

I believe it is reasonably simple to trace the NorCal2030 receiver with a RF signal generator and two channel 50MHz scope.

1) Verify that the CLK A and CLK B VFO signals are 90 degrees shifted.
2) Feed the radio with a radio signal at VFO + 600Hz.
3) You shall see 600Hz sines at the outputs of the U2a and U2b (detector preamps). They shall be of the same amplitude and 90 degrees shifted. When you change the RF generator frequency to VFO - 600Hz, you shall get the same picture on the scope, only the phase shift will be inverse.
4) Measure phase difference between input and output of the audio phasing chains, see figure 131. One leg will shift its signal by 45 degrees, the other leg by minus 45 degrees. Together they shift the phase between I and Q components by 90 degrees.
5) Measure phase difference between outputs of the audio phasing chains. The phase difference shall be 0 degrees for the correct sideband, 180 grades (opposite polarity) for the opposite sideband. Therefore the signal will sum between the outputs of UA3b and UA3d for correct sideband and diminish for the opposite sideband.

I think that's all to it.

8031. Antenna and power supply

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-18 03:53:32 UTC
From: Bob Flye
Topic: 8031 Message: 8031

Greetings all,
I received my ATS-4b kit a week ago and nearly halfway through the build. This is my first ATS kit and first post for that matter. I have been doing a lot of thinking about antennas and power and had a couple of questions. I am pondering a battery pack and antenna tuner in one enclosure. Tuner first. My preference is the end fed half wave antennas of AA5TB, I like the great match you can get and the tiny tuner, the down side being a separate wire for each band. I do have an T1 tuner too.

Question 1: What antennas are most folks using with success that are minimal in weight and size?

Power next. I am looking at several options. First option, 9v battery. Second option, six AA cells, either Ultimate Lithium's or NiMh. Third option is 12V. Size becomes a factor with 12v as I want to put power and tuner into one enclosure, but will consider 12v if persuaded.

Question 2: What power options have most found they like?

Sorry about asking such newbie questions. I thought about reading older posts, but my antenna likes and dislikes keep evolving, and I suspect with time and experience, most others do too.
Great to join the ATS group!

If you're interested in utilizing an EFHW antenna, Bob, check out the nifty little tuner that Stu, KI6J, has kitted up! Go here for pics and info: www.betterqrp.com

Stu's tuner is easy to assemble and is receiving rave reviews - believe there'll be an article on it in the February QST magazine as well.

After looking his tuner kit over and if you are interested in combining a battery pack and his tuner (you wouldn't need his enclosure then, you'd be looking at integrating battery and tuner in a new enclosure) e-mail Stu as he's been thinking about putting something like that together and may have some ideas for you - Stu and I talked about that very subject earlier this week!

Good luck with your endeavor, Bob. 72, Jim Rodenkirch, K9JWV

Hi Bob!

Got luck in building the ATS-4B. Be aware of the 2N7002! They are VERY sensitive to static electricity.

1. End Fed Half-Wave Antenna with a Hendricks SLT+ tuner supported by a 12.5 meter fiber glass mast from DX-Wire in Germany. Minimal in weight and size, no feeder to the antenna and works just as good as an ordinary dipole. The mast is the best compromise I have found between rigidity and portability. I work 80, 40 and 30 meters when out in the field.

2. 10 AA-size Ni-MH batteries of 2500 mAh. With the ATS-4 this give you plenty of time to work on the bands. An option I will try this upcoming season i a 6800 mAh 12 volt Li-ion battery from Hong-Kong found at ebay.co.uk.

3. Between 4 and 5 watts is enough to work all over Europe with a well placed EFHW antenna. Hight over ground and the placement of the antenna is more important then the power you are using. How and where to do it comes with experience! The only way is to get into the bush and try yourself!

These are very important questions. Can tell you, Bob, that anything you can gather to shorten your experientail curve is worth it. I have been a year making adjustments that work for me, but what works for me may not fit the appplication of everyone, or even anyone, else!

EFHW: Many of my hills and deployments are treeless, either because they are high desert, or because they are above treeline. I deploy on a 16 foot or 20 foot crappie pole. the former weighs 12 ounces, the latter 22 ounces. I use #22 insulated teflon wire, tough and light.

the height is such that on 20 mtrs the 34 foot wire is so low that radiation is NVIS ... or is it? If I deploy on a steep slope, then the slope is my reflector in the desired direction. If I deploy on the edge of a cliff, then that direction is certainly not NVIS.

I like the tuner kit offered by Stu, KI6J. It is the AA5TB tuner with a Tayloe SWR bridge for tuning, and weighs about 3 ounces. I use NO feedline at all. I mount both the tuner and the ATS3B or ATS4B ON the pole using rubber bands. I sit next to the pole. I do not guy the pole. The pole is stuck in a crevice in the rocks and pulled to one side, bracing it, by the wire.

Battery: I treid 9 volt, but it quickly loses voltage. I tried NiMH, but it, too, quickly drops voltage. I tried Lithium AA's, but it intially is too high in voltage, and has a steep voltage drop curve. Therefore I use 3S LiPO's.

The 3S LiPO's start at 12.5 volts, but quickly drop below 12 volts, and level off between 11.1 and 11.6 volts. A mere 950 mAH LiPO which costs seven dollars and recharges hundreds of times weighs about 3 ounces and powers the ATS rigs about four hours. I have made a voltage controlling switch for it, SPDT center off mini-toggle, gives me three voltage levels to choose from. Straight through, through one dropping diode when battery is fully charged, or through four dropping diodes while tuning.

entire set up weighs less than two pounds.

the following picture may be worth a thousand words.

Bob:

End fed wire of random length with a wide range tuner is a very good, lightweight setup. KD1JV designed one such wide range tuner. I think it's being sold by Hendricks or someone else in kit form. It's very similar to the arrangement for the LDG autotuners, except it has little "Pins" (I seem to remember that somebody's version has switches) instead of relays for various inductances and capacitors. You could even use a variable capacitor like what is called a "Polyvariable capacitor" which would simplify the number of switches or pins needed.

I routinely use a 31' jackite pole and a LDG-Z-100 autotuner for "short" trail jaunts. Since my trail rig (an "original AT-Sprint - no suffix) only covers 40/30/20 meters, I can vouch for its effectiveness on these three bands. KA5S and I tuned a similar antenna to 80 meters for FYBO 2010 with a loading coil which was handy - don't recall the value of the inductance.

WB3AAL has a "Black widow vertical" which fits on a 16' jackite pole and requires no tuner. See http://www.wb3aal.com/Pages/BWV/BWV.htm for details. It covers 40/30/20 (and maybe 15 meters?) It uses a 20' jackite pole has a tapped coil at the base and several radials. WB3AAL has over a thousand contacts from the Appalachian Trail, many/most of them made with this antenna.

For Power, I use 8 NiMH cells, 2600 mAH, which gives me about 10 volts when fully charged, and 8.4 volts later. I get 3 watts @ 9 v which is sufficient for many contacts. I personally think it's better to be conservative and not push the 12 volt limit.

8036. ATS-3C or maybe MTR (mountian top rig)

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-18 22:40:32 UTC
From: Steven
Topic: 8036 Message: 8036

It looks like I can fit a 2 band, single board (no plug in filters) variant of the 3B into an Altoids tin. The power and phone jacks are not mounted on the board, which will make putting it into other types of boxes easier. Bands will be selected using three DPDT slide switches in a manor similer to that used in the ATS-4's.

I figure 2 bands is twice as good as 1 band, though it is only half as good as 4 bands. I also figure most SOTA operations happen on 20M (here in NA anyway) and if your out for an overnight, also having 40 is nice. Plus you can use a single EFHW wire on both 40 and 20.

Building for 80 or 30 would also be possible. The simplest thing for me to do would be to supply parts for all four band filters and let you decide which ones to use when you build it. To keep supply current absolutely minimum, the upper freq will be 20M.

Now the best part, I think I can do this for less than $100. Not much but less, but less. Since I want to spend most of my summer away hiking, I suspect I should get on this post haste, eh?

After much time, aggravation and temper lost, I found the problem. The pcb was not completely etched and there was a bridge under the component designator mask(white paint), under the D3 zener cathode end, directly under the paint. I found it with a extremely bright Mag Light flashlight on other side of the pcb and a 25x magnifier. It was still very hard to see because there is copper on the other side, so it was in the dark shadow area. There was no way to see this without the back lighting/candling with the flashlight.

Whew, only time, temper and 3 2N7000's lost.

Did the LED digit make the cut?

Is there going to be any kind of volume control, even if it is software controlled?

Steve,

20m and 40m would be the perfect combination for a mountain top rig at least in the eyes of this East Coaster. Our experience in the east with SOTA goes like this. Hike early to mid morning. Get on the air late AM or early PM. 40m first to work the east coast chasers before the band goes long, then QSY to 20m. In the early afternoon 20m is open to Europe and the West Coast. This could be a winner.

Subject: [AT_Sprint] ATS-3C or maybe MTR (mountian top rig)

It looks like I can fit a 2 band, single board (no plug in filters) variant of the 3B into an Altoids tin. The power and phone jacks are not mounted on the board, which will make putting it into other types of boxes easier. Bands will be selected using three DPDT slide switches in a manor similer to that used in the ATS-4's.

I figure 2 bands is twice as good as 1 band, though it is only half as good as 4 bands. I also figure most SOTA operations happen on 20M (here in NA anyway) and if your out for an overnight, also having 40 is nice. Plus you can use a single EFHW wire on both 40 and 20.

Building for 80 or 30 would also be possible. The simplest thing for me to do would be to supply parts for all four band filters and let you decide which ones to use when you build it. To keep supply current absolutely minimum, the upper freq will be 20M.

Now the best part, I think I can do this for less than $100. Not much but less, but less. Since I want to spend most of my summer away hiking, I suspect I should get on this post haste, eh?

The LED digit is retained but there is no volume control as before. There simply isn't room for either a mechanical or digital one. Audio level will be limited to about 800 mV peak to peak, which is reasonably loud without being deafening. Those with poor hearing can increase that to 1.2V peak to peak and those with very good hearing can add an in-line volume control to thier headphones.

8047. Re: [AT_Sprint] Re: ATS-3C "in line volume control" - suggestion

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-19 02:23:30 UTC
From: Gil WA5YKK
Topic: 8047 Message: 8047

Steve, et all the group;

I had to think about the suggestion of a in-line volume control, then my memory did a quick flashback to a few days ago when I found that a Sony or other very portable CD player arrived for me to listen to, it has an FM tuner incorporated. To my surprise, a tiny piece of plastic turned out to be an inline volume control, and works quite well.
For anyone with a less-than-modern update on new items off the shelves, this one can probably be found and obtained almost anywhere, just "trust the Internet", and find the lowest price.

Just a suggestion, before my memory slips and I forget my next item in line.

Steve, you do a great job on packaging, now I have too many projects for the winter, am almost looking forward to frustration in all the different areas of construction from every kit. Keeping the brain cells going with a lot of thought makes for a challenge which is what we're all about.

Only one plea to all, I lost an old friend to cancer, so pray for a cure. It just "happened" to five of my past classmates and a favorite teacher, out of nowhere! Funerals are a difficult time for us all.

Best wishes, 73's
Gil WA5YKK

The LED digit is retained but there is no volume control as before. There simply isn't room for either a mechanical or digital one. Audio level will be limited to about 800 mV peak to peak, which is reasonably loud without being deafening. Those with poor hearing can increase that to 1.2V peak to peak and those with very good hearing can add an in-line volume control to thier headphones.

Steve-
I like the concept; particularly having 2 bands on one filter board in a small footprint. I love my ATS3 but would enjoy working 2 bands without opening the lid. Although I'm ready to start building my ATS4b, I would really like to have your ATS3c as well as it fits a different niche use for me (overnight business trips).

20m and 40m is a perfect choice for a 2 band SOTA rig.

Would the switches be accessible from inside the tin, or from the top? Each has its own, I personally would hate to make the three holes.

> Now the best part, I think I can do this for less than $100.

Guess you will run at least two hundred of these. For a hundred dollars people will tear your hands away, as one Czech proverb goes.

Great idea Steve !

The 40m/20m combo is perfect for SOTA and portable QRP in general.

Anyone who has ever tried to swap ATS band modules in the dark, or with freezing fingers will appreciate this rig. Four bands are great, but sometimes "less is more" and I think that having a pocket-sized dual bander would be awesome.

I think that you should break with the ATS naming convention and call it "Katahdin", or name it after some other AT Peak.

8065. LED hole in Altoids tin - MTR

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-19 14:58:29 UTC
From: Fred Maas
Topic: 8065 Message: 8065
Attachments: 1 described; binary payloads are missing from this source WARC

In the spirit of sharing ideas ... may be useful to others, or perhaps someone has a yet even better idea !!!

I made three cases for my Altoids tin ATS3B. Each of the first two times, there was something that didn't quite satisfy me about it. the most difficult was the square hole for the LED. In the end, here is how I solved it.

The problem: I kept winding up with ragged metal around the hole.

The solution:

* Cover the area (or the whole surface) with masking tape.

* Draw the square.

* Draw the diagonals.

* drill a small hole where the diagonals cross, the center in other words.

* with a tiny jeweler's saw (which is a tiny coping saw) run the balde through the hole and reinstall it in the frame of the saw.

* cut all four of the diagonal lines.

* and finally, fold the triangles under and behind, making a rolled surface of the edge of the hole.

Here's a photo of the result.

Well, it would be nice to have a back-up rig for the ATS-4b.
A two bander for 80 and 40 meters would be something for the upcoming season?s SMFF-activity.
Not that I really need one, but it?s fun to build these things.
So I guess I will order one too. :-)

I too find the ATS rigs irresistible.. I have four and I am sure if a new one comes out, I will dive in and get it as well.

I keep telling myself that I can learn the MSP430 code and really personalize it (especially the keyer).

I will erase all the digi mode stuff if that is what it takes to make the keyer work right.

I have never been satisfied with the keyer on the ATS3. I just cannot use it without frequent errors.

I don't understand this. Can you expand on what the frequent errors are and what seems to cause them?

I have found the rigs don't like dirty key contacts, maybe due to the low voltage/current the ports work at.

I too find it more difficult to use, I've got several other keyers and
the one on the ATS3-B seems the most error prone.

Mike's (W1MT) firmware is different, haven't tried it so can't say if
it's better.

> I have found the rigs don't like dirty key contacts, maybe due to the
> low voltage/current the ports work at.

Might also be a factor.

On an allied subject, if I wanted to use the ATS-3B as a practice
oscillator without connecting a dummy load is it enough to remove the
band module to protect the PA?

From: Hank Greeb
Topic: 8036 Message: 8082

I too, have never been satisfied with the keyer on the ATS3. I just cannot use it without frequent errors. Of course, I can't send anything resembling International Morse Code, even my own call, with ANY Electronic Keyer, except one with a keyboard. In the daze before computer generated code, I was living in SW Ohio, and folks accused me of having a "Lake Erie Swing" when I used my Vibroplex Blue Racer bug. It seemed the initial DASH of a word (and somewhat each character) was lengthened quite a bit.

Since I've been listening to the computer generated code which I send whilst on contests, I find I can send better when I attempt to send a complete thought, but I make enough errors that I won't actually force anyone to struggle through copying such sending.

For the life of me, I don't understand why folks insist on butchering the code by attempting to use an electronic keyer when they often can't even send their own call twice in a row without a misteak.

I've been known to send a stack of 20 or more formal NTS messages to the receiving station with only an occasional "R" between, nary a mistook in a 15 or 20 minute transmission. (That was in my earlier daze - I haven't tried it for several years.)

It's an issue with the timing of the firmware and not the hardware. If you used another keyer and got used to it at 25+ wpm, the keyer in the ATS rigs will give you fits.

My version of firmware is an attempt to get closer to the standard Mode A and Mode B timing, using the idea of latches. You have to check during the middle of the current character then use a latch to get the timing just right. Especially, important for Mode B. Some ops like the latch at 50% some earlier and some later. But without the latching and only checking at the end of the character havoc is wreaked on high speed ops.

Caveat, I am not a high speed op, but I have worked with a few to get the Mode B keyer in my firmware to their satisfaction.

Unfortunately, there is no standard to follow but most other keyers use this type of algorithm for Mode B.

8091. keyer timing

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-19 19:09:43 UTC
From: Steven Carr
Topic: 8036 Message: 8091

yeah...it should be that all modern keyers behave the same (depending on mode) because they should all be running the same algorithm. unfortunately they don't and the reason is that it is difficult for a developer to find information on the "proper" algorithm for the timing of a iambic keyer. many years ago while coding firmware for a keyer I tried to research this and never did find a proper answer. that there are now so many versions of cw keyer based on different designers doesn't help when trying to reverse engineer what "proper" cw keyer timing is.

when I tried reverse engineering proper keyer timing I made a couple assumptions. first, keyers were developed before microcontrollers were common so everything needed to remain simple for a hardware only design thus there are no special timing delays. second, the difference between Iambic A and Iambic B was whether actual or latched paddle inputs were used. here's what I came up with...

Iambic A: when it comes time to key out the next element (dit or dah), the paddle inputs are checked and a dit or dah keyed out depending on actual paddle inputs.

Iambic B: when it comes time to key out the next element, latched paddle inputs are checked and a dit or dah keyed out depending on the latched paddle inputs. the start of keying out the new element clears the input latches.

has anyone researched this and found the "proper" keyer timing algorithm? also I'd be curious (but am now too busy to read the code) about the actual algorithm used in the ATS rigs, as well as the W1MT versions.

Yes, the B mode it the one which is most confusing and I had a hard time figuring out what the "standard" algrithum for implenting it was. The way the 3 series works is it tests for "both paddles closed" at the end of a dot or dash element. i.e., at the start of the inter-element space.

I have since learned that proper B mode is ANY time both paddles are closed, add the extra element to the end of the string. So, that is the way the keyer in the -4 works and any future rigs.

Personally, I find B mode a little too touchy no matter how it's implemented and much perfer A mode.

Shucky durn, I didn't speak up quickly enough on the latest offering for an AT-Sprint Version II.

I'm still looking for an ATS II either built or kit. I have the orginal version, and a ATS-3b, so the ATS II would fill out the series. Please contact me direct if anyone has one which they'd be willing to sell.

Subject: [AT_Sprint] ATS-3C or maybe MTR (mountian top rig)

| It looks like I can fit a 2 band, single board (no plug in filters) variant of the 3B into an Altoids tin. The power and phone jacks are not mounted on the board, which will make putting it into other types of boxes easier. Bands will be selected using three DPDT slide switches in a manor similer to that used in the ATS-4's.
|
| I figure 2 bands is twice as good as 1 band, though it is only half as good as 4 bands. I also figure most SOTA operations happen on 20M (here in NA anyway) and if your out for an overnight, also having 40 is nice. Plus you can use a single EFHW wire on both 40 and 20.
|
| Building for 80 or 30 would also be possible. The simplest thing for me to do would be to supply parts for all four band filters and let you decide which ones to use when you build it. To keep supply current absolutely minimum, the upper freq will be 20M.
|
| Now the best part, I think I can do this for less than $100. Not much but less, but less. Since I want to spend most of my summer away hiking, I suspect I should get on this post haste, eh?

Steve:

Is it possible to use 5 way jog switch instead of the four actual control buttons? I think that this may make it a little easier to operate and you can create a volume control on it. By the way, one switch use less space on the board too.

I like the MTR name more than use one of the Appalachian names, but this does not matter if the radio is as good as the others with a new simple user interface.

I have never been satisfied with the keyer on the ATS3. I just cannot use it without frequent errors.

I don't understand this. Can you expand on what the frequent errors are and what seems to cause them?

I have found the rigs don't like dirty key contacts, maybe due to the low voltage/current the ports work at.

Steve

This sounds like lots of fun even without any mountain in near sight. Pitty though for no casing (my drills don't seem to like the little tins very much + you did a great job on the ats4 case). But I'll still buy (at least) one if I get the chance :-)
For that price & looking at the current feedback I'm guessing you will brake another "sold-out" record.
Guess I will need to keep an eye on this group for your posts even more than before... any idea when the idea transforms itself into a production?
(One might consider setting up a poll in this group, it could give you an idea on the targeted quantity...)

Anyway, great thinking!

Br, Benny.

I'd also read the "add extra element..." description, but it never sat well with me. It always seemed like a description by someone who had used a keyer but wasn't concerned with technical implementation details, and it never helped me determine how the keyer timing was supposed to be. I decided that the "extra element" is not intentionally added, it is merely an inherent function of input latching.

Earlier today I described my thinking on Iambic B (when it comes time to key out the next element, latched paddle inputs are checked and a dit or dah keyed out depending on the latched paddle inputs. the start of keying out the new element clears the input latches.). Then I saw W1MT Mike's comments about latching at 50%, which reminded me of an old discrete logic design I had examined.

The discrete logic design acted just as I previously described, except that instead of clearing the input latches at the beginning of the next element as I did, the discrete logic design waited a half clock cycle (1 clk = 1 dit) to clear the input latches. waiting that half clock cycle creates a window where a paddle input might not be detected so I saw that delay as a deviation from the ideal timing easily achieved with software, however the delay also removed the potential of a race condition therefore was probably a good compromise in simplifying the discrete logic design.

Fortunately this is all software/firmware, making it less urgent than laying down copper so Steve need not worry about it for a couple months.

I went scrounging and found 2 ATS III kits.
One built with 40M module in Fossil Watch box with parts for the other 3 bands. I also have 1 unbuilt ATS III in package. SRY could not find another II. There is a spare ATS IIIB somewhere in shack but I have not located. Also 1 original ATS but that is not for sale.

8107. Voltage Monitor on the ATS-4?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-20 02:09:17 UTC
From: brianpepperdine
Topic: 8107 Message: 8107

Sorry, but I read the ATS-4 via PDF keyword search and don't see very much at all re. what seems to be voltage monitor on the lower right of the LCD display (which I recently noticed is back-lit.. cool.. didn't see that before... is that controllable to save battery... or so low consumption is does not matter?)

The displayed voltage:
is it the INPUT voltage at the connector
or
is it the voltage after the initial regulation?

What is see is lower than what my external voltage meter sees at my DC connector on the end of the cable coming from the my variable voltage supply set at 9 VDC. My variable supply has a fairly accurate meter of its output level.

So to run at 9 vdc to 'be nice' to the finals... should I run it at 9 V from the supply or can I up the supply a bit so the ATS shows 9 volts?

Also, the ATS display does not seem to alter much if I lower or raise the supply voltage? What is the delta of time the ATS-4 uses for the monitor display update? If I turn it off and then back on it does see the changed voltage at that changed off/on state.
Tnx....

from Steve's description of how he programmed it, the operator needs to linger on the dit contact longer to get it to take. Apparently I DO that already, because I have no problem with it. It is going to impact any letter with an inserted dit, or a trailing single dit such as an "R" will become an "A" if the op doesn't linger on the paddle long enough.

I bet the op will have less trouble at higher speeds!!! That may be another less than intuitive solution to sending with it. Try it.

Somehow, I'll be forever glad that I never got into the electronic keying idea, had been trained on that "wild hoss" of a J-38, & then started in on a Vibroplex paddle, so I'm a mechanical keying type. Guess that's a good way to stay until I have time to figure out all the problem children in electronic keying. A couple of kind souls gave me electronic keys "many moons ago", only problem being that I got no instruction booklets with them, or knew that they needed batteries! Might be a good thing, they're "button and shiny little transistor" technology, probably only good for a museum.
One had "cracking and dying of age" plastic paddle parts, thus I learned that quality control is too often not a paid position with the older companies.

Can anyone give me a hint about a really good electronic keyer? I think I have them built into the gear in my stock now, but lighting them up will be the trick. (Is this worth the time to pursue?)

73's
Gil WA5YKK

from Steve's description of how he programmed it, the operator needs to linger on the dit contact longer to get it to take. Apparently I DO that already, because I have no problem with it. It is going to impact any letter with an inserted dit, or a trailing single dit such as an "R" will become an "A" if the op doesn't linger on the paddle long enough. I bet the op will have less trouble at higher speeds!!! That may be another less than intuitive solution to sending with it. Try it.

Yes unfortunately for "us poor souls" who learned Iambic B, unlearning it is like trying to teach pigs to fly ;-)

My first keyer was a Heathkit HD-1410 that I got back in 1980.

I can go back and forth between keyer, bug and straight key. If I can, so can others with a little practice.

A bug is swung from the elbow, a straight key from the wrist, and a paddle with the finger tips with almost no motion of the arm at all. If you purposefully choose to learn motions that don't conflict, then you can easily have them all at once. Many who originally learned a bug will swing at paddles, too, but there is no vibrating spring to activate so there is no need to do that.

A keyer I like is from Jackson Harbour kits. His Island keyer will do three modes including the Ultimatic. with 56 memories, you may not need to actually send ;-)

Performance wise, the absolute best keyer I have _ever_ used is a kit from K1EL. (just google K1EL)

The one that I am referring to is the K42 which is a bit overkill for paddle keying since it includes keyboard abilities. It is truly awesome with all the params you can dial into it and it is extremely immune to high power RF (a big problem for keyboards). I use it for both paddle and keyboard sending.. (mostly paddle). Once you get this keyer dialed in to the way you like to send, it is flat out awesome. It has a rotary shaft encoder (not a pot) for dialing up and down your speed and the display shows the speed when you make a change. Your paddle sending is displayed on the screen as you send. The only down side is that it exclusively uses the keyboard for making parameter changes.. but I can live with that since there are so many params that you can quickly adjust.. It even has a hardened PTT line that you can use to key an amp.

http://farm7.staticflickr.com/6104/6338613300_e989eeee16_b.jpg

The other one that was my favorite before I got the K42 is the Idiom Press CMOS4 Keyer.

Gil,

You have received lots of info on electronic keyers and I believe that any of the suggestions would work out well for you.

Chuck Adams has a iambic tutor on his web site. I would suggest that anyone making the switch to paddles from a straight key take a look at this tutorial. He teaches the squeeze method. If you follow his method you will love using a electronic keyed and a good set of paddles. Also mode B is the only way to go, if you are using the squeeze method. Those that slap the paddles around would probably be better off with a single lever paddle that is very heavy!

Here is the direct link to Chuck's tutorial: http://www.morsecode.nl/iambic.PDF

Good luck!

The backlight is dimly lit all the time. It's not noticable until it gets dark and is set to be just bright enough that you don't have to shine a light on the display to read it in dim ambiant light.

The battery voltage is measured after the input diode and on switch, so reads about .3 or .4V lower than the actual input voltage. This only applies to the -4. Rev A and B versions have a correction added to make the voltage read closer to the actual input voltage.

The orginal -4 units also have a minor bug which caused the timer used to periodically update the battery voltage (and the auto shut off timer) not to start. (there's always something). However, the battery voltage is updated after any function which writes to the bottom line of the display is used.

On mine, the voltage displayed coincides with what is at the input, at least as measured by my Fluke DVM.

I measured the current at receive as 45ma on my rig. I thought the same thing about maybe conserving energy by turning the backlight off. At 45ma, I could not justify the effort...I bet Steve came to the same conclusion.

The voltage appears to update only after a few seconds pass. I did nto check how many. If you change the input voltage, power down and then up again, it should show correct, but by my estimates based on tinkering, just wait.

From: Stephen Wandling
Topic: 8120 Message: 8120

Question: Am I the only guy out here who's slapping dual lever paddles around like they were single lever?

Until quite recently I thought I-AM-BIC might be the first words spoken by a ball point pen.

60 years ago I started pounding on a J-38. After a 50 year break I was re-licensed and bought another J-38. But I was hounded: "Try paddles!" "You'll love them". So I bought a plastic Hi-Mound dual lever for cheap at a hamfest and screwed it down next to the J-38.

I am so so so glad I didn't know what iambic meant when I began the steep learning curve for using the paddle. Otherwise, I would probably still only be using the J-38 today.

The Hi-Mound and J-38 are still right where I put them, but I have the American Morse DCP and my favourite Dennis Foster's Micro, all apparently capable of talking like a ball point pen, but don't.

BTW, I got the Micro (I believe I have the last one that Dennis, KK5PY, ever sold) because Steve, WG0AT, had one for his ATS3 and I even put mine in a wine cork like Steve's. But, even Steve calls this key a Te-Ne-Ke, as do lots of other folks. While the technology looks to be quite similar, the Te-Ne-Key is the product of Boyd, NE8KE, and is maybe twice the size of Dennis's Micro. Do I have this correct?

The battery voltage is measured after the input diode and on switch, so reads about .3 or .4V lower than the actual input voltage. This only applies to the -4. Rev A and B versions have a correction added to make the voltage read closer to the actual input voltage.

Steve KD1JV

Steve,

My particular ATS4-rev B reads high rather than low. And it isn't consistent. It reads .3 to .5 volts high for my LiPO's and bench supply.

Is the added "correction" a component the value of which might be adjusted to close in on actual???

Hi John,

I presume that you saw my questioning about "Micro" and "Te-Ne-Key"?
It's my understanding, from communicating with Dennis Foster, KK5PY,
that he wasn't connected with Boyd Mason, NE8KE. Boyd apparently holds
the patent to the Te-Ne-Key. Unfortunately, Dennis' business was wiped
out in a fire.

Since you use the combined term for your paddle, maybe you have some
information that I don't? As a retired project manager I still have
problems with an unresolved question. :-)

Thanks,

He sure seems to sell a lot of iambic keyers for someone so opposed to it!

All I know is that I started on a straight key, went to a bug, then an iambic keyer. Iambic suits me just fine - I'm not into high-speed Morse and the iambic method is much more comfortable for me up to 35 - 40 wpm or so compared to single-lever. And I rarely send that fast - usually 25-ish or so.

I guess that's why they continue to make all types of keyers and paddles.

more useful is being able to switch between right hand and left...that way you can key and log with different hands. I never could learn to write with my left hand, but keying with the left isn't so bad. (a trick is to turn the paddle around so that dits are still on the thumb)

There are too many variables to produce a really accurate reading without a means of calibration. First there is the 5% resistor in the voltage divider, then there is the 2% tolerance of the 3.3V supply used as the A/D voltage reference, a little bit of error is introduced converting the binary A/D result into a scaled decimal reading and finally, the actual voltage drop across in the input diode and switch will vary with temperature and current.

My 4B reads dead on at 9V and 0.1V low at 12V.

So, the idea wasn't to provide a really accurate voltage reading, just accurate enough to give you a good idea of where what condition your battery is in.

Yes, there is a variable you can tweak in the source code to more closely match the actual supply votlage located on line 1954 < dadd #060h,r7 > where the hex number #060h is the variable.

Steve
My particular ATS4-rev B reads high rather than low. And it isn't consistent. It reads .3 to .5 volts high for my LiPO's and bench supply.

Is the added "correction" a component the value of which might be adjusted to close in on actual???

8128. Accu-keyer timing

Yahoo group: AT_Sprint (2012 — 2013)

From: Steven Carr
Topic: 8110 Message: 8128

that need to linger is probably why I had problems with the 3b
timing...I'd either linger too long or not long enough.

I've given up on trying to remember how I implemented my keyer those
many years ago...so I found a discrete logic keyer circuit to analyze.

At the following link is a schematic for a Accu-keyer. I have entered it
into the ktechlab circuit simulator freely available on ubuntu (anyone
who cares to play with it can ask me offline for my circuit file).

http://vk1od.net/module/EA78Accukeyer/

The inputs are latched such that once a paddle contact is made it does
not have to be held any longer. However once an element (a dit or dah)
is started, the corresponding input latch is effectively held in reset
for the duration of that element and its trailing space. When it is time
for the next element to be sent, the previous element's input latch is
masked if the opposite element's latched input is active to allow
opposite element priority.

So...at any time while one element or its trailing space is active, a
momentary input (however brief) on the opposite element will be queued
and sent immediately after the current element and trailing space are
done. Also...the input for the current element and trailing space may be
held until the instant just prior to the end of that trailing space and
that element won't be repeated.

The same website has a small keyer IC (see following link) which appears
to use the same algorithm in software as the Accu-keyer does in hardware.

From: Mike
Topic: 8129 Message: 8129

Howdy,

I've had my ats3 for a long time - can't recall exactly when I built it. Recently a couple of people have asked me whether it's an ATS3A or B and I've answered that, as far as I know, it's just a plain old ATS3.

Can someone tell me the history here? Was there originally an ATS3 (no rev) followed by A and B models? Or is the original ATS3 the same as an ATS3A?

73,

Mike - ke5akl

8133. Re: ATS-3C or maybe MTR (mountian top rig)

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-20 23:33:57 UTC
From: Mike
Topic: 8036 Message: 8133

Steve.

The keyer in my ATS3 used to give me fits. I'm an iambic B guy but when I toggled to the B mode I'd always get extra dits - As turning to Rs, etc. To be honest, I found the B mode unusable. With A mode I'd tend to drop elements, As turning to Ts, etc. Since my call has an A in it, this could get really frustrating. It's quite embarrassing when you can't send your own call right... :-)

For awhile I actually gave up on paddles with the ATS3 and used one of those little Russian straight keys with it. The big drawback with that was no direct frequency entry. And with the ATS3 there's no way to get around this since the power-up auto key detect means that the only way to switch between paddles and straight key is to cycle power.

After some practice and adjustment I got to where I could send passably in the A mode, but still with more errors than usual. I found this interesting since, with other keyers I find the A mode unusable.

At some point I taught myself how to send with a single lever paddle. With this kind of sending it doesn't matter what iambic mode you're in since both contacts are never closed at the same time. This turned out to be the answer for me with the ATS3. I just treat the paddles like a single lever key and all goes fairly well.

73,

Mike - ke5akl

Steve,

I like the idea of the two-band rig - although 20-30-40M would be a lot better. I use these three bands often when portable, sometimes in the same session.

When there are contests, it's so nice to go to 30M and escape the crowds. There are usually interesting QSO's and QRP people there.

Another idea is to make the rig capable of several bands, with removable modules, but make space for just 2, and be able to choose between them with switches. That way we could set the rig up for what we want to do. In the winter 80M is really useful.

My ATS-3B worked 28 states with 44 Q's on 80M in the NAQP this past weekend, in about 1-1/2 hours, with an end-fed wire 140 feet long at 30 feet, while camping in a tent in the snow in the mountains. 40M went long, and everyone moved down to 80. It also performed well on 20M earlier, in the late afternoon. Fantastic piece of gear !!

The other thing I'd want to see in a new rig is a knob for frequency tuning. This would vastly improve the agility and utility of the rig.
If there's not room for an encoder and knob, maybe put a jack in the rig so we can plug in a knob tuning device. Steve, you could sell it as an add-on accessory for $$$ like Elecraft does with their added features.

I would order a dedicated single band, dual band, or whatever ATS rig that covered 12 and 10M if it were available, just because the idea of working DX from mountain tops and wilderness sites appeals to me - even though it would only be useful for a few years. With a 17 foot dipole you could work all over the world. Portable beams are very possible on 10M....

My dreams - thankful for fun times with ATS3A and B!

From: James Rodenkirch
Topic: 7828 Message: 8136

Last reminder to submit your log(s) for the QRP ARCI Pet Rock event: Entries must be received via e-mail; if submitting via snail mail, your entry must be postmarked on or before
22 January, 2012 (and send me an e-mail to let me know that you are submitting via snail mail).

So far, we have 22 entries with Phil, K0CD and Don, W2JEK, leading the pack as far as entries for xtal controlled rigs are concerned! Phil and Don have posted scores that will be

difficult to best IF you don't turn in your logs - besides, participation numbers are what "works" when it comes time to decided which contests will be "supported" in 2013.

A reminder that the Winter Fireside Sprint is coming up - 2000Z to 2359Z on 29 January 2012. Mode of operating is SSB - I believe I have microphone around here somewhere!

The "usual rules," apply with standard bonus points available if you opt to operate portable. I'll be sorta tuckered out from operating in the CQ WW 160 contest over that weekend

BUT intend on working as many of you as possible during the Fireside Sprint - a new and very colorful certificate is available so check the various categories to see which category

might suit you and your station - get on the air with QRP SSB - it's all fun! Check this contest out, rules and all, at www.qrparci.org

72, Jim Rodenkirch, K9JW

QRP ARCI Contest Manager

From: Bob Flye
Topic: 8138 Message: 8138

Greetings all,
My ATS-4b was finished last night and with one exception works fine. I am getting 45 mA on receive, at either 9 or 12 volts. On transmit, I am getting 630-660 mA, from 80 meters to 20 meters, at 5 watts.
The only exception is 15 meters, I am getting 511 mA and 3 watts out, and that is at 12 volts. Any suggestions would be appreciated!

OK,
Replying to my own message. Chatted with another friend who has an ATS-4. I was skeptical that I could get that big a change with compressing windings. I compressed L20 windings and the transmit current went up from 511 to 650 mA, and I am now just above 4 watts. The current is right in the ballpark with all the other bands. I think I am going to stop now before I do something dumb. Any comments are still welcome.

8140. Iambic keying

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-22 20:48:47 UTC
From: Steven
Topic: 8140 Message: 8140

I've been looking into the Iambic keying issue and decided the best way to find out the proper way for it to work would be to go back to the source which set the standard. That would be the Curtis 8044ABM chip. Google quickly found the original application note written by John Curtis himself. This is what it has to say about A and B modes:

For example, (iambic A mode) if you squeeze the key paddles, leading slightly with the thumb (dot paddle), you can easily produce the Morse "period", "di dah di dah di dah". Some other characters produced by releasing the squeeze earlier, are the "AR" (di dah di dah dit) or the "AA" (di dah di dah), the "R" (di dah dit) or the "A" (di dah). By starting the squeeze with a dash, we can produce characters like "N", "K" and "C".
By squeezing during a letter, we can make other characters like "L", "Q" and so forth. Squeeze keying is fast and easy since it minimizes finger and wrist motion.

Type "B" iambic

The procedure described above is typical of what we call iambic type "A" or the original Curtis method. In type "B" iambic, a squeeze released during an element (dot or dash) will cause another alternate element to follow the one being produced.

For example, it you squeeze to produce a "period", then you must release during the third dit (or the space following). The last dah will automatically transmit. For another example, to make a "C", you must release during the second dah (or the space following) and the last dit will automatically transmit. Presumably, this further reduces the effort to produce some letters. But at high speeds, the necessity to release during the (very short) dit period may be difficult. The window for action on the "B" type is one-half that on the "A" type.

Okay, now we know how B mode is suppost to work. A squeeze released during an element will produce an opposite trailing element.

Therefore, in B mode, to send an A or N by squeezing both paddles requires releasing the paddles as soon as the first element starts sending. In order to avoid sending a K or R instead, you need to be really quick, so one should avoid squeeze keying for making A's or N's.

Both my keyer and the keyer in the Ten-Tec Argo V work as above, as does a K1EL keyer I have. However, the K1EL keyer seems to have slightly different timing. The paddles have to be squeezed farther into the dot or dash before they are released to get the alternate element to send then my keyer or the Ten-Tec does. I can see how that can help avoid

mistakes at the higher speeds.

Okay, one last issue. A vs B. On closer inspection, it turns out there is basically no difference between A and B modes in my implementation. They are both B mode. I said I look for both paddles closed at any time to set the extra element flag, but that is not the case. It is only tested at the end of an element being sent. This condition is already effectively tested for during the sending of an element by looking to see if the other paddle is close and if it is, setting a flag to produce that element. Checking again for both paddles closed at the end of sending an element is redunent and is the only difference between A and B modes in my implementation. I always thought B mode was more difficult to code for, but it looks like A mode is more tricky.

I'll tweak the timing on setting the flag for opposite element generation for squeeze keying and see if that helps and try to see if I can do a proper A implentation which doesn't result in dropping elements instead.

There is one big advantage to not having knobs on a small portable rig ...

In bad weather (rain/snow etc) you can use a resealable plastic sandwich or smallish freezer bag with the bottom corners snipped off to keep the rig and battery dry.
You just route all of the cables in through the snipped corners. Once everything is connected up to the rig, slip it and the battery into the bag and seal it. Its not 100% waterproof but it sure goes a long way towards keeping things dry. If you have ever tried rotating a tuning knob on a rig while it is inside a plastic bag you will appreciate the button interface on the ATS rigs.

Steve,

John Curtis wrote an application note (see link) regarding his 8044ABM design.

http://users.ox.ac.uk/~malcolm/radio/8044screen.pdf

His document mentions dot memory and dash memory. Do you have that, or are you just polling at the end of an element? (And did you literally mean that you poll at the end of the element, or do you actually poll at the end of the element's trailing space?)

Yes, that is the document I found and quoted from.

I do dot and dash memory sensing during the sending of an element. This memory is what enables B mode to work. I find doing memory sensing during an element space to really make for garbled sending, especially at the higher speeds. Ideally, I should be using level change interupts (high to low) for doing the paddle memories, because polling can't tell if the key just closed or has been closed. But at least with the 4B, the paddle ports don't support pin change interupts.

I've been fiddling with the keyer routine and I belive I have A mode working as it should, and B mode less prone to adding an extra element when not wanted. If anything, I've always had problems dropping dits and that is really apparent now in A mode if a dot is to trail a dash as the final element. The paddles have to be held closed until the final element you want starts to send and once used to B mode, that is difficult.

I'll play with this another day or two, then post the new routine for those who built a programming cable and want to try it out.

Steve KD1JV

John Curtis wrote an application note (see link) regarding his 8044ABM design.

http://users.ox.ac.uk/~malcolm/radio/8044screen.pdf

His document mentions dot memory and dash memory. Do you have that, or are you just polling at the end of an element? (And did you literally mean that you poll at the end of the element, or do you actually poll at the end of the element's trailing space?)

8147. ATS-3B finals choices and mods

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-23 18:31:52 UTC
From: tlcfarmer@yahoo.com
Topic: 8147 Message: 8147

I now have a set of 3 2N7000's and another set of 3 BS170's that I can choose to put in my ATS-3B that I recently got working after fixing the pcb. During the removal of the previous finals, I may have damaged the solder pads, so I really only want to do this once. Which of these 2 transistor sets would rather have in your ATS-3B? Did you add any kind of heatsink? (I have seen the picture KX0R's setup). Did you put heatsink compound on the transistors?

Hi Steve and others.

I took my time to play with K1EL keyer running at extremely slow speeds and tried to mimic it in my ATS-3b firmware. I had to look into the source code and here is the pseudo code how my keyer behaves:

1)
No paddle closed. Wait for dot or dash paddle contact to be closed.
When closed, start the symbol.

2)
At the beginning of a symbol:
Clear the latch of an opposite paddle.
Wait 1/3 (or 1/2 of a dot length, or nothing, based on user preference). Don't latch the opposite paddle in this interval.
2a)
Wait the rest of the symbol length including the symbol space and latch the opposite paddle:
if Iambic A -> Latch on falling edge of the opposite paddle.
if Iambic B -> Latch on low level of the opposite paddle.

3)
At the end of symbol space:
If an opposite symbol was latched -> Send the opposite symbol, go to 2)
Otherwise if both paddles are closed:
if ultimatic mode ->
if ultimatic with priority -> Start the symbol with higher priority (either always dot, or always dash)
else Start the same symbol
else Start the opposite symbol
else if dot paddle is closed -> Start dot symbol
else if dash paddle is closed -> Start dash symbol

4)
At the end of symbol space, if not Autospace mode, then go to 1), otherwise:

Wait for the letter space interval and check for dot or dash paddle contact to be closed.
When closed, mark which paddle was closed.
Wait the rest of the letter space and latch the opposite paddle:
if Iambic A -> Latch on falling edge of the opposite paddle.
if Iambic B -> Latch on low level of the opposite paddle.
Start the symbol for which the first paddle was closed.
Go to 2a)

That's all.

The main difference between Iambic A and B is that A latches on falling edge, while B latches on low level.

I believe the main difference between the correctly implemented keyers is whether there is the guard interval between 2) and 2a), where the opposite paddle is not latched. K1EL has the delay configurable and is set to 1/2 of a dot interval by default. Me based on Mike's code I have set it to 1/3 of a dot interval. I believe the delay lowers number of errors, but it is a personal taste and I bet if one learns to send without the delay, it will be confusing to him.

Hope it helps to make the topic clearer. Let me know if I was not clear enough.

Hi Steve and others.

Once more, this time with correct formating.

I took my time to play with K1EL keyer running at extremely slow speeds
and tried to mimic it in my ATS-3b firmware. I had to look into the
source code and here is the pseudo code how my keyer behaves:

```
1)
No paddle closed. Wait for dot or dash paddle contact to be closed.
When closed, start the symbol.

2)
At the beginning of a symbol:
Clear the latch of an opposite paddle.
Wait 1/3 (or 1/2 of a dot length, or nothing, based on user preference).
Don't latch the opposite paddle in this interval.
2a)
Wait the rest of the symbol length including the symbol space and latch
the opposite paddle:
if Iambic A -> Latch on falling edge of the opposite paddle.
if Iambic B -> Latch on low level of the opposite paddle.

3)
At the end of symbol space:
If an opposite symbol was latched -> Send the opposite symbol, go to 2)

Otherwise if both paddles are closed:
if ultimatic mode ->
if ultimatic with priority -> Start the symbol with
higher priority (either always dot, or always dash)
else Start the same symbol
else Start the opposite symbol
else if dot paddle is closed -> Start dot symbol
else if dash paddle is closed -> Start dash symbol

4)
At the end of symbol space, if not Autospace mode, then go to 1),
otherwise:

Wait for the letter space interval and check for dot or dash paddle
contact to be closed. When closed, mark which paddle was closed.
Wait the rest of the letter space and latch the opposite paddle:
if Iambic A -> Latch on falling edge of the opposite paddle.
if Iambic B -> Latch on low level of the opposite paddle.
Start the symbol for which the first paddle was closed.
Go to 2a)
```

That's all.

The main difference between Iambic A and B is that A latches on falling edge, while B latches on low level.

I believe the main difference between the correctly implemented keyers is whether there is the guard interval between 2) and 2a), where the opposite paddle is not latched. K1EL has the delay configurable and is set to 1/2 of a dot interval by default. Me based on Mike's code I have set it to 1/3 of a dot interval. I believe the delay lowers number of errors, but it is a personal taste and I bet if one learns to send without the delay, it will be confusing to him.

Hope it helps to make the topic clearer. Let me know if I was not clear enough.

The yahoogroups online editor screwed up the formating, which is important when writing a pseudo-program. I posted the description into the files section, OK1IAK group.

Congratulations on getting it working Bob! Nice job.
Mine has about 4 and a half watts more or less on all the bands. I would button it up.
You did well by being careful too. I almost always make some mistakes it seems.
What setting did you use on the Hakko solder station ? Mine worked after I reheated two joints but I could not really tell they were faulty by inspection. Probably my inexperience with SMD QC inspection.

Is there anyway to get a bit more audio gain out of the ATS4.
My hearing's not what it used to be, but when using the ATS4 I always have the volume fully wound up. It's actually a totally redundant control at the moment! The signals are in there, but without a little external audio amp I struggle to hear them! I know that when I come to use this outdoors, wind noise will drown out any audio unless I also carry an external audio amp. I've tried various ear buds/phones but there's not much between them.

Hi Pete,

I have the ATS3-B and not the ATS4, but it seems to me that folks were finding the audio volume of the ATS4 to be adequate? Can you do a check by having a friend listen and tell you if they also find the volume to be low? If they do, then you may have an issue with your ATS4 that's needs to be resolved.

The 4B has an AGC to limit the output amplitude to about 400 mV peak (0.8V p-p) That can be increased to 1.2V p-p by removing R46, located just above the '386 audio amp. Or you could remove C30 and eliminate all AGC action. I would remove R46 first, 1.2V p-p hurts my ears...

Steve

Steve's right on, the BS170s are better, and if they are optimized well, they can be driven with a 9v battery, at least during tuneup, and more often than not, during operating, for even less stress...and longer battery life. Yes, temp compound is good, very level top of transistor to case insures heat transfer too.
Have a great day,

Steve and Dale,

Thanks for the reply's

I will put the BS170's in. I will get some heatsink compound tomorrow and put some on each one when I bend them over. The drain and source are swapped on th BS170's so the rounded side goes towards the pcb. I was thinking about making a heatsink out of a section of some left over 1/2' copper pipe that I have. I'll look at the heatsink in KX0R's picture again.

Dale, what do you mean by 'optimized well'? I only got 3 and it takes all 3, so I am just going to get what I get, I think.

Again, thanks.

Hi Lincoln,
What I mean by optimized is tuning the toroids for the max power vs minimum current used. With 5 plus watts out on each band, you can afford to trim back with the input voltage to attain 3.5 plus watts at 9v input.
Have a great day,
Dale - WC7S

Steve and Dale,

Thanks for the reply's

I will put the BS170's in. I will get some heatsink compound tomorrow and put some on each one when I bend them over. The drain and source are swapped on th BS170's so the rounded side goes towards the pcb. I was thinking about making a heatsink out of a section of some left over 1/2' copper pipe that I have. I'll look at the heatsink in KX0R's picture again.

Dale, what do you mean by 'optimized well'? I only got 3 and it takes all 3, so I am just going to get what I get, I think.

Again, thanks.

Lincoln

>
> Steve's right on, the BS170s are better, and if they are optimized well, they can be driven with a 9v battery, at least during tuneup, and more often than not, during operating, for even less stress...and longer battery life. Yes, temp compound is good, very level top of transistor to case insures heat transfer too.

Dale,

I punched Trevor Smith into QRZ and got a 16 hits. If you know what
call zone he's in or state, that would narrow it down.

Here's the other side of the Iambic issue. I don't do Iambic and don't want to try to learn it. I guess I can't break the mindset of the keyer doing something that I didn't tell it to do.

For those of us who just swat (albeit lightly) the paddles back and forth like we are using a single lever, it appears that just plain old self completing is all we need. I am more comfortable with A rather than B. Plus I like some dual paddle keys better than some single lever.(izzat ambivalence?)

How do other slappers get along with the A and B modes? Is anyone happier with one over the other? Or does it make any difference which mode is used? Am I the only one that doesnt use or like iambic modes?

Just wanting to see how other non-Iambic ops handle their paddles and keyers.

Thanx for listening.

Subject: Re: [AT_Sprint] Iambic keying

Yes, that is the document I found and quoted from.

I do dot and dash memory sensing during the sending of an element. This memory is what enables B mode to work. I find doing memory sensing during an element space to really make for garbled sending, especially at the higher speeds. Ideally, I should be using level change interupts (high to low) for doing the paddle memories, because polling can't tell if the key just closed or has been closed. But at least with the 4B, the paddle ports don't support pin change interupts.

I've been fiddling with the keyer routine and I belive I have A mode working as it should, and B mode less prone to adding an extra element when not wanted. If anything, I've always had problems dropping dits and that is really apparent now in A mode if a dot is to trail a dash as the final element. The paddles have to be held closed until the final element you want starts to send and once used to B mode, that is difficult.

I'll play with this another day or two, then post the new routine for those who built a programming cable and want to try it out.

Steve KD1JV

John Curtis wrote an application note (see link) regarding his 8044ABM design.

http://users.ox.ac.uk/~malcolm/radio/8044screen.pdf

His document mentions dot memory and dash memory. Do you have that, or are you just polling at the end of an element? (And did you literally mean that you poll at the end of the element, or do you actually poll at the end of the element's trailing space?)

I always use Iambic Mode B. I tried mode A but never liked it. There is rather huge difference between A and B, and I tend to make too many errors with A.

Thanks Steve, I'll remove R46 and see what difference it makes. Funnily, when I looked at the manual to see where R46 is, I notice that in all the photos it appears to be 1 Meg not the the 220K specified, except for the little picture on page 23 where it's missing completely!
I take it you've played around a bit with this one?

OMs;

I've been in a never ending search for a simple answer to a simple problem, the control cable connections to the Hy-GAIN AR-40 rotator. For reasons unknown, neither my little manual on my rotator or anything on the Internet site has a diagram or any hint on what wire, what color, goes to any given screw on the input of the rotator itself.
If anyone has any idea, kindly let me know, email direct, it's easier to tap into the Pentagon than to get answers out of Hy-Gain!

Thanks for the bandwidth, I'm lost.

From: w1dry
Topic: 8172 Message: 8172

Hi all,

Please ignore this message if it has already been identified.

Spotted a disparity between the part id for L9/L10 and the schematic.
The schematic shows a 3.3 uH inductor and the assembly on page 15 shows 3.9 uH. I presume the value is 3.9 uH as this is what is provided in the kit. Does the schematic need to change on the assembly docs?

Cheers,

Mike

Topic: 8172 Message: 8173

Please ignore any thing the schematic says if it conficts with the assembly info. The schematic is the last thing to get updated with a minor change and sometimes not at all.

3.3 uH were at one time used. Then when I went to get more, they were out of stock, but there were pleanty of 3.9's to be had. It's a lot easier to change 3.3 to 3.9 in the text of the instructions then it is to revise the schematic, even had I remembered it had to be done.

Gil see if this helps any.

It is a five wire and I would try using the numbers on the control box (shown in the manual) and then assume that the rotor is numbered 1-5 Left to Right if it has 5 screws on it.

I have only used AR-22's and Ham M types (8 wire) so I do not know for sure.

Gil,

There really is no good answer to your question. The proper wiring of the controller is totally dependent on the way the rotor was wired. There are some conventions on which color wire is used for what functionality. However, there is no way to know exactly how the rotator was wired unless you actually check out the rotator connections.

Hank, et all;

My extreme thanks to everyone who responded, I've had two URL references to a repair shop, got them printed out. Now, the activity on the rotator will depend on the weather (again), and my careful attention to detail as I do the hook up. The one OM at Hy Gain chimed in, too, with one problem, he didn't give me a color code to screw position readout, nice of him to be concerned. Got that from the repair shop website.
The one remaining item is to remove the bottom portion of the rotator and check for synthetic grease, I don't recall what I used when I went ahead to do that little change, learned about it the hard way when a past CDE "melted into junk" longish ago.

Many, many thanks for all the help, now the work begins.

Now, back to the ATS-2,3,4 - whichever of Rick's rigs makes this group smile! (My backlog is on my spare bed and my "kits" desk!)

73's, keep warm!

8184. Suggestions for ideas for a new rig

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-26 19:59:44 UTC
From: n8xxham
Topic: 8184 Message: 8184

I didn't see a suggestion for this idea, so it may be unique to me?

If so, mebbe it's of questionable value

Anyway, if there were a couple "guide pins" for the band modules for an AT-Sprint (any vintage) it would be a bit easier to change bands when out on the trail. Some times in inclement weather and/or evening with low light, changing bands is somewhat of a challenge.

Just a very, very minor suggestions, but if there's another 5 or 6 band version in the future, why not include guide pins?

I suspect the answer is very simple. *No space*! They would need space
on the board which is already used by components. Since they would be
through-hole they would take up space on *both* sides of the board too.

8187. Thermal Electric Generators

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-27 02:54:44 UTC
From: Steven
Topic: 8187 Message: 8187

I ordered a TEG (thermal electric generator)yesterday which should prove interesting to play with. It claims to be able to produce up to 15 V at 1 A, or 15 watts and at 3" x 3" x 0.5" is reasonably small. However, what kind of delta T it takes to produce 15W is not specified, I'll have to figure that out on my own.

A TEG is made up of bimetalic semiconductor junctions wired in series/parallel. When placed between two metal plates (typcially aluminum), then heated on one side and cooled on the other, electricty is produced. These can also be use in reverse, putting current into them will cause one side to get cold and the other hot. This is known as the Peltier effect and is used for CPU cooling. However, I found out the coolers have all thier juncitons wired in parallel, so only produce a small voltage when used as a generator.

My plan is to use the TEG to charge Li-ion batteries during extended hiking trips. It's easier to arrange for fire at night then sun during the day! But there is something I want to try. For charging batteries, I will only need 5 V at a few hundred ma. Since that will have to be regulated, why not take the "wasted" power and put it back into the generator by mounting the regulator on the "hot" side of the TEG? In theory, over 10 watts can be pumped back into the TEG.

I'm wondering if this can effectively bootstap the process. Cold running water is typically available out in the wilderness. Put the cold side heatsink into the running water and electricity should be produced though maybe not a lot at first. If this is disapated directly into the hot side of the TEG by a power transistor, it should start to warm up, making a larger temperature differental, making more juice and so on until some equalibrium is reached. Shades of perpertual motion :-)

Another question is will there be enough surplus energy left over to do the charging? Yet other question is if the process has to be started by first heating up the hot side and if it would then remain self-substaining?

But if that doesn't work, plan B is to get a little backpackable wood stove and use that as the heat source. I'm looking at one made of titanium plates which lock together to make a box. Since this stove has flat sides, attaching the TEG to it would be simple.

The advantage of Plan A is that if it works it could be left unattended all night to charge something. Plan B would require keeping a close eye on the wood stove, which goes through fuel quickly. Not a lot of fuel, but it burns up small sticks pretty fast.

In any event, this should prove to be interesting to try.

Hi Steve.

I looked into the possibilities of a thermoelectric pot some 7 years ago. I thought of using the Peltier cells in reverse and putting them on fire, but I gave on the idea when I found out that they are made of some kind of semiconductors (Tellur I believe) and soldered. I was afraid that the connections inside the Peltier cell will melt when put on fire and abused thermally. One shall make sure that they are cooled effectively, the best being connecting the other side to a pot filled with cold water by a thermal compound, I suppose. You bring the water to a boil, forget it, let it boil out and you destroy the cells. That does not sound like a solid solution to me.

The efficiency of the thermoelectric cells is about 4% if I remember, which is about one half of a solar cell.

> I ordered a TEG (thermal electric generator)yesterday which should prove interesting to play with. It claims to be able to produce up to 15 V at 1 A, or 15 watts and at 3" x 3" x 0.5" is reasonably small.

Would you give us a link to your source of the cell, please? I wonder whether they are able to withstand more thermal abuse than the Tellur Peltier cells.

I doubt that you will generate any reasonable energy by just cooling the other side with a cold water. Bootstrapping the cell by heating it with an electric current sounds like a perpetuum mobile idea. You need to keep a reasonable temperature gradient between the plates to generate some power. If you preheat the plates with electric current and then cool one side of it with cold pot, the temperature of the cell will equalize soon after you disconnect it from the current source. It will generate enough energy for sure if you put it on fire and don't burn it though.

Good luck, Vojtech

Steve,

I was going through about 2 years of this list and found a very good suggestion for a tuning mode by Ken AA7JC, which is trivial to implement:

> I am thinking that in reality, there are times when everyone resorts to a low power dead key as they struggle with difficult tuning situations in a field environment (and does a station ID at the end of course). The ATS3 even has a dead key tune position in its menu. There is no power adjustment so it is either full power or nothing.. given the choice of a full power dead key or a full power low duty cycle rapid pulse, I would choose the later every time (its easier on the finals and the battery). I would not eliminate the dead key feature, I would just add another choice..
>
> I have an MFJ device that does this at 75WPM, 13% duty cycle and I
find it to be wonderful.. That is why I would like to see this as an option in the ATS3X rigs..

There are just three buttons used in the tune mode. Key down, key up and escape. The fourth button could be used for the low duty cycle tune mode.

By the way, I have made a great experience with a small electric fan intended to fire up the char coal grill. It is powered by a single AA cell. You make a little chamber out of three or four stones, fill it with sticks, fire it up and keep it burning with the fan. Such a stone stove burns hot even with a little bit of wood waste like cones. We even cooked on dry cow dung in Mongolia the way the locals do. I find the small fan to be easier to carry than a gas stove.

Steve:

This sound very good to experiment with. Not sure what kind of TEG, but if you need some titanium to do something yourself, you can try here http://www.knifekits.com/vcom/index.php?cPath=46_368 for some metal sheet.

By the way, I never been hiking, but those TEG, can produce some energy if use with the hot side close the body and cool side just expose to the ambient low temp, not sure if this is a good idea, but who knows.

A friend of mine has traveled all over world doing bio research,
He found these devices in Siberia and parts of Mongolia. They have been around for many years although probably not very high tech.
Seems to be in use in areas with no normal power available.

Steve,

regarding the surplus 10w idea...the TEG is not very efficient, so it would be better to step down the voltage and increase the current. this would have the benefit of reducing how much input heat you need.

Here's the backpacking wood stove I'd recommend (in titanium, but also available in stainless):

http://www.vargooutdoors.com/Hexagon-Backpacking-Wood-Stove

something to think about...to keep a fire going in a small stove you will need to use small fuel, so you won't be able to leave it unattended for long. also these stoves aren't really intended to run for long periods, so ash buildup may start limiting fresh air needed for the fire.

From: cloud runner
Topic: 8194 Message: 8194

Seems like a very good idea. Would add that I always "tune" up my antenna/tuner by.

* reducing the voltage 3 volts by switching in four diodes in series with the battery supply line, and

* using a Tayloe SWR bridge which sends 75% of the power into 50 ohm resistive load, and

* by sending dits, only 50% duty cycle, while watching the SWR bridge LED go out.

I have never used the "tune" mode for tuning or anything else, for that matter.

I would, therefore, like to suggest that:

* make the default of the tune mode Vojtech's low duty cycle, and ...

* in the tune mode, automatically switch several dropping diodes in series with the power source so that the extior voltage controller so many of use would become unnecessary.

the ATS3B in an Altoids tin weighs a little over two ounces. The voltage controller which includes a toggle switch which I consider necessary to operate the ATS3B in the field, weighs more than an ounce. it requires an extra cable with jacks and plugs to get in and out of it, a toggle switch, and something for a case. but all that is really needed is a coupla diodes and a way to instruct when they are in the DC line. This outboard device weighs 50% as much as the entire radio, and could be disappeared with a couple of diodes and a little program logic.

Reading about your research reminds me of the wood burning Zip stoves built by ZZ Manufacturing and designed for backpacking (http://www.zzstove.com/). They have a small integral fan to keep the stove burning at higher temperatures. The fan could be used to consume some of the excess power when heating the TEG.

However I keep thinking of the schemes proposed to generate electricity using the motion of walking - which there will be plenty of in your pursuits. Here is a recent development that caught my eye...

http://www.christianpost.com/news/power-your-gadgets-by-electricity-from-walking-54506/
http://techcrunch.com/2011/08/25/nanopower-shoes-could-generate-20w-of-electricity-during-walking/
http://www.instepnanopower.com/Default.aspx

Perhaps they are looking for testers?

www.tegpower.com/pro3.htm It's not cheap at $80.00, so I hope it really is useful. Rated up to 325 C. The 15V , 1A might be at 260 C, but I'm not sure how one would make that big a temperature differental across a half inch!

>If you preheat the plates with electric current and then cool one side of
>it with cold pot, the temperature of the cell will equalize soon after you

I wouldn't pre heat it by putting a current through it, my idea was to use the current it generates to heat a power transistor, which puts heat back into the generator. The only question is what would it take to get the process started? I suspect fire will be required.

BTW, what started me on this path is a commercial backpackable wood stove with one of these built in. http://www.biolitestove.com/BioLite.html Unfortunetly, it is not yet available and costs $170.

From: Petr
Topic: 8199 Message: 8199

Hi,

as Miroslav informed me last week although his famous Rotary encoder kit for ATS was retired already he is thinking about its comeback. He is still getting the orders and gathered enough requests for another batch of PCBs and ICs orders to complete the kits.

So my hint is to not wait and check the link here:

http://diy4fun.blogspot.com/2010/01/rotary-encoder-for-ats-transceiver.html

and here:

http://diy4fun.blogspot.com/2010/02/rotary-encoder-for-ats-assembly.html

... and order the Rotary Encoder kit for Your ATS jewel in good time.
It is suitable for all ATS series but describe him which type You have as the last ATS-4 version is slightly different.

>I believe your concept is in the realm of perpetual motion?
Yes, it does sound that way, but this is actually an energy harvesting system. I'm really curious as to how much of a temperature gradiant is needed to get the kind of power I need. (say 1W) Would it be possible to put one end in cold water (a pond or stream) and use a rock which has the warmth of the day stored in it as heat source? Would feeding any excess energy produced back into the system significantly improve the overall effeciency or would that be a wasted effort?

Most likey the only really practical method will be to attach the generator to the side of a wood stove, or place a can full of hot coals on top if it, with the other side heat sunk to a puddle of water. Solar isn't a practical energy source when your on the move during the day and often under tree cover. Power produced by heat in the evening sitting around a camp fire seems much more practical.

Topic: 8187 Message: 8203

It's too bad they don't supply output curves for the device. If it takes 500 deg F to achieve 15 W, I doubt that the output would be straight line, which would mean 1 W would need only 15 deg F differential. Do these devices tend to have a 'start threshold'? I.e., no output until some minimum temperature differential is achieved?

Looking at the Biolite system, it shows what seems to be a much larger area thermocouple and a significant heat sink on the 'cold' side. But, I don't see any mention of their electrical output capacity. If find that bothersome.

BTW, I wonder about their 'Home Stove'. Charging a cell phone in rural Africa or a poor Indian home, seems 'silly' at the least. And there are lots of designs for inexpensive (or even free) 'rocket' stoves that are able to burn small twigs effectively, as well as the commonly used dried animal manure. I make mine, for backpacking, from tin cans.

A few years back a bought a few crank LED flashlights, that had a jack for the 3.6 VDC output, to charge a cell phone. I had several opportunities to check out the cell phone charging and it worked well. Unfortunately, at that time I had a Motorola phone, so I don't have the necessary cable for my smartphone, but I will probably make one soon.

I look forward to your 'tests' when you get your unit.

Hi Lee,

A lot of comments and reactions are placed inside the forum emails about this radio. But, it is in Steve "work bench", so not sure if he have a link, yet. Any way, the radio is running in the ATS3 family small form factor with only two bands design.

The main difference are, that you may select which two band you fabricate it from a group of five from 80m to 20m, and the two band are installed on the radio main board with switch to change wich one to operate like the ATS4 radio. Also, some fixes/changes on the ATS3 firmware program. And a lower price than the the ATS4.

I may be wrong so, Steve can give us a better project idea, but this is mor or less, the new radio concept.

Keep reading the forum emails and participate on it learn more.

If there is enough interest we could save $20/unit on a bulk order of 10
or more of the TEGP15. (I'd be interested in 2 units)

I found this video interesting, and it also triggered a memory. Awhile back a friend sent me a link regarding a 13 year old who had designed a solar array by using the Fibonacci sequence. He had a bunch of ~2" square panels that were installed in a 'tree' form, at "Fibonacci angles". The professed advantage was that, when compared with another 'fixed' panel, the 'tree' maintained higher voltage output during a day of insolation.

I poked around and finally found a EE that had critiqued the experiment and who, very reluctantly, pointed out that the kid was only measuring open circuit voltage, which on a solar panel quickly jumps to the 15 to 17 VDC range and doesn't vary much with different amounts of insolation. It's the current that varies significantly during various amounts of sunshine.

All of the thermal experiments in the video were done without any load on the circuit. And as we saw the unit quickly starts producing it's open circuit voltage, but the current available is related to the thermal conditions, just at the current available from a solar panel is related to solar conditions. What would have been valuable to see is what the charge rate would be for a battery. This the video doesn't show.

But, this doesn't mean that one can't get usable output from common situations, with these units. I will be keen to hear Steve's results.

Steve,

Did you consider the HTTEM modules? If you only need 5v, maybe wire two of those modules in parallel and mount them to the bottom of an altoids tin...which should leave about 1cm clearance in the tin for a low profile heatsink or thin fan.

to heat simply open the altoid tin lid 90deg and stand on end near a campfire or wood stove.

a candle lantern might be more convenient than a campfire if you only need a short recharge cycle. I'm guessing you know exactly which one I'm thinking about, but I've included links for non-backpackers. also there now is a tea light lantern that is smaller and collapsible.

No, didn't run across HTTEM modules. I did find some raw 3 and 5 volt modules. But at about 40 a piece, the 15V unit mounted to aluminum plates from TEGpower seemed to be a better deal all in all.

I started thinking about the candle powered idea last night. I like this idea because then you could say your rig runs on one candle power :-)

The TEG I ordered is a little too big for an Altoids tin, but that general idea is sound. The youtube video Lincoln, N9IN found gave me some ideas. I'm thinking a combo water reservoir and fan for the cooling side. Well, since it could be a couple of weeks before this thing shows up, got lots of time to think up schemes for using it...

Arthur :

Good stuff !

I did something similar for the band modules for my ATS-3A.
I took a spare Altoids tin and cut a piece of anti-static foam (the stuff that you stick ICs in) and glued it to the inside of the tin. The foam is thick enough that I can plug the band modules into it and they stay put.

I was also concerned about damaging the toroids on the band modules (especially the 80m module as the wires are really small) so I used a Doug Hendricks trick that I gleaned from building the commercial version of KD1JVs ALT Tuner.
I put a tiny sliver of hot glue between the toroids and the band module board and gently heated with hot air until it melted.

I don't recall Steve, but we may have talked about this as we walked the AT one day in Maine. Years ago I did some work with some piezoelectric plastic sheet. It had similar properties, except instead of heat, it involved mechanical motion. You could apply voltage to it and it would produce mechanical motion. I was using it for a acoustically coupled telephone modem design I was I was doing. It was functioning as the loudspeaker material.
The inverse was also true, you could hit it with mechanical motion and it would produce electricity. I never did investigate how much "power" it would generate, but I suspect it would be minuscule. Then again, maybe not, sometimes this stuff can be deceptive. I think we talked, probably in jest, about how we could make shoe liners for hikers and have the material generate power to charge the rig batteries. I figured at worst, it could "monitor" our feet during hiking and report on how they're doing..."blister forming on toe #3, assistance advised." Of course now with Twitter, we could take that a step further (excuse pun) and even have the stuff Tweet our feet, letting everyone know their status:
@HamFoot right foot thinks the left foot is lost. LOL Owner sends #CW like 2 left feet, sounds like K1YPP
Wow, didn't take me long to get off topic...
Dennis, K1YPP

http://tegpower.com/pro4.htm

Man, I wish I had seen those first! 5V can be plugged directly into the things I need to charge and at 1.2" square, these are small enough that an Altoids tin set up may be practical.

Guess I'll just have to order one of these also.

Hi group,I always liked the sprint and as time goes by I want one even more. However I am on an anti seizure med to control damaged nerves in my legs and it did get rid of most of the pain and I can walk again. However it took it's toll on my vision and putting a PICO keyer is an effort and after 15 minutes items that are 5 feet away look like their 20 feet away so I looking to buy a built unit or pay to have one built. Please E mail me off list.
Thanks Bob AF2Q

Piezoelectric makes really tiny amounts of power. Typcially a fairly high voltage at tiny currents. Just enough to make a spark and light the grill, hi. Using a bouncing magent in a coil of wire (like the flashlights) is one approch I've seen taken to extract energy from walking. I lost track of the site which was trying to make that work, so I don't know if they ever did or not.

If you could build little hydrolic pumps into the heel of the shoe and use that to run a generator, that might work, but the plumming would be a hassle.

All in all, I think the thermal electric generator is looking to be the most practical approch for extended hiking trips when away from mains power for a week or more at a time.

Steve kd1jv

The inverse was also true, you could hit it with mechanical motion and it would produce electricity. I never did investigate how much "power" it would generate, but I suspect it would be minuscule. Then again,

8224. QRP Hydro

Yahoo group: AT_Sprint (2012 — 2013)

From: Stephen Wandling
Topic: 8224 Message: 8224

I'm working on homebrewing a micro (qrp) hydro system. It will be used as a local demonstration site, with the hopes of leading to others getting off grid. This would be a system that will generate QRO power, in the range of 1-3 KW. I lied about the qrp. ;-)

The commercial systems use a ~415 V, 3 phase induction motor as their generator. I can source one on eBay, as well as a high voltage/current 3 phase bridge rectifier.

The suggested advantage for using such a motor is that it's much easier to move high voltage from the generation site, to the place it will be used and then convert it to DC there.

If this motor will be putting out ~350 V, 3 phase, and I will want a regulated DC output of around 12-17 VDC, how might I best achieve the voltage drop? With a 3 phase transformer ahead of the bridge rectifier (and where might I find one, or how might I make one) or some other system, after the bridge rectifier? The LM117/LM317 units have a maximum input voltage of 40 VDC.

My theory is weak in this area. For example, if I apply 350 V, 3 phase to a 3 phase bridge rectifier, what output voltage would I expect?

Any help/ideas will be appreciated.

Steve;

I took advantage of an offer for "door size solar panels", sent off just a few $$ for two, & they arrived a week later - carefully enclosed in a door-size cardboard carton, each. The idea isn't to power a hand-size rig, but to float charge a large battery which can keep my rig(s) on the air, "12 VDC style", when the local Candle, Power, and Lantern (CPL power grid) fails, for one reason or another.
For reasons unknown, perhaps that pesky salt ionic structure, the copper and steel wire grid tends to decay badly, and it got really bad after the whole outfit had changed directors, so AEP took over. Within a year, we had shutdowns on such a regular basis that most folks would look at a thunderstorm rolling toward us, go inside to shut down everything, then keep the freezer doors closed for two to three hours after the first "boom and flash".
Finally, someone decided that the huge grid which holds the transformers might do better with a metal building over them, and that work is more than half done. We haven't had a major shutdown in awhile, but I'm still looking for the correct size and type of 12 VDC battery for my QTH-powering solar cell system. The final part of the circuit will be to switch the AC grid totally out of the circuit to the rigs, when I hear "boom", or see a flash.
There are so many protective circuits plugged into my wall outlets that I've spent the price of a fancy rig on them, with the result being no damage to anything, computers and radio gear - over years.

What we could use is to have witchcraft and alchemy work, get away from the raw, hard, expensive facts of electricity! Too bad no one has figured out where to stand, and attach a long arm to the surface of the earth, use the rotation to do all the work, spin a pretty big alternator! (Well, after all, the science fiction of 50 years ago is now science fact, overall - those writers gave a lot of ideas to inventors - look at the ATS series)

I'd be looking for a 3 phase transformer, though 3 normal ones would likely do the trick too. If you convert the raw AC from the generator to DC, you'd need a big hunking switching supply or you'd be able to heat the house with the heat disipated by a linear regulator! (or use that heat for a TEG and make more power...)

I have a small stream about 300 yards away from me. There are a couple of natural water falls of sorts where I could set up an "over the top" water wheel without too much trouble. Been thinking of using a car alturnator for the generator.

What someone needs to figure out is a way to direct lighting bolts into some giant capacitors and then extract it in a controlled manor.

BTW, I found the place which makes the kinetic energy harvesting device based on the bouncy magnet www.npowerpeg.com It uses a 1000 mahr battery to store the energy in. They claim 26 minutes of walking will power a 3G phone for 1 minute! I wonder how far you'd have to walk to go from say 50% charge to full charge on the internal battery? Probably a very long way!

Oh, but one snag to directing lighting bolts - who's gonna hold the
spike up, during a thunderstorm, and attach it to a cap that can handle
the amps, with the volts being ungodly?

Anything that stores electricity for any work would need a darn good
chart to figure out if the response is linear or exponential. Hand that
task over to military Basic Trainees, tell them they can get another
stripe pretty easy from all that walking and running!

Where is Benjamin Franklin, his key and his kite, when we need him?

I just got around to building the decoder. When I turn it on, the LCD stays blank. Adjusting the contrast does nothing. The voltages look good. If I connect up the audio, select CW mode(I guess), D1 LED blinks with the CW signal. It seems that the processor is working. I'm thinking that the display is bad.

Any ideas? Anybody have a source and part number for the LCD?

About the voltage level when rectified AC, the formula is multiply your source AC voltage by 1.414. This why the '50 tube radios without transformer work on the 150 VDC.

The mods were done. LCD pin 2 has 2.7VDC and pin 3 voltage varies with the contrast pot.

I see a display on DigiKey that looks to be an exact replacement. It is a HD44780U unit. My concern is that the spec sheet says it requires 5V.

8233. QRP ARCI Fireside Sprint is history!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-01-30 14:26:36 UTC
From: James Rodenkirch
Topic: 7828 Message: 8233

Well, the Fireside Sprint is over and we appreciate all that joined in for the fun. A reminder to submit your log(s) - regardless of the number of Qs, it's the known number of participants that helps us determine which contests/events remain "on the calendar" in the coming year(s). One fella turned in his log with one QSO and I thanked him for that as the logs all count and have weight!

Next up is the 2012 QRP ARCI HF Grid Square Sprint from 1500Z to 1800Z on 10 March 2012. A little three hour session with a relaxed exchange.
The mode is CW.
The exchange is:
Members send: RST, 4 Digit Maidenhead Grid Square (i.e. FN02), ARCI member number.
Non-Members send: RST, 4 Digit Maidenhead Grid Square (i.e. FN02), Power Out

Lookin' forward to hearing and working you on the bands and in the various QRP ARCI contests/events.

Hi Bob.

The display is 5V indeed. Its logic runs from 2.7V, but the backplane needs at least 4.5V. Therefore the controller generates a square wave, which is rectified and negative voltage is generated. The negative voltage is fed to the hot end of the contrast pot, which you shall be able to measure with DVM.

I saw a site with such a wheel, that was about 10' in diameter, with 6"
x 6" 'spokes', that was chain coupled to a jackshaft that was belt
coupled to an alternator. The wheel was turning at about 15 RPM, so it
needed lots of 'gearing' to get the alternator to a suitable speed.

Vojtech! That was the info that I needed. Cool circuit. I had no minus voltage. I had to resolder the ground lead of D4. Then I had -2.7V on the hot end of R9. Still no display. I had managed to kill R9. Put in a temporary replacement and I have a display.

Joy, but not complete joy. The splash screen looks Chinese or Japanese. The only thing that is recognizable is "1.0". Resoldered the four data lines from the CPU to the lcd.

JOY OH JOY! It works - copies CW and PSK.

Hi Steve,

This is a good plan to use the TEG for generating power with a candle. Bravo..
This practical principle go back in 195xx's look at the side

http://www.aqpl43.dsl.pipex.com/MUSEUM/POWER/thermoelectric/thermoelectric.htm look below

Was a russian desing used for radio receivers, scale it down and I think it will work a question of engenering...

73' Joris van Scheindelen PE1KTH Tninking also on Magnetic motion generating Hi..

--- In AT_Sprint@yahoogroups.com, "Steven" <steve.kd1jv@...> wrote:
>
> I ordered a TEG (thermal electric generator)yesterday which should prove interesting to play with. It claims to be able to produce up to 15 V at 1 A, or 15 watts and at 3" x 3" x 0.5" is reasonably small. However, what kind of delta T it takes to produce 15W is not specified, I'll have to figure that out on my own.
>
> A TEG is made up of bimetalic semiconductor junctions wired in series/parallel. When placed between two metal plates (typcially aluminum), then heated on one side and cooled on the other, electricty is produced. These can also be use in reverse, putting current into them will cause one side to get cold and the other hot. This is known as the Peltier effect and is used for CPU cooling. However, I found out the coolers have all thier juncitons wired in parallel, so only produce a small voltage when used as a generator.
>
> My plan is to use the TEG to charge Li-ion batteries during extended hiking trips. It's easier to arrange for fire at night then sun during the day! But there is something I want to try. For charging batteries, I will only need 5 V at a few hundred ma. Since that will have to be regulated, why not take the "wasted" power and put it back into the generator by mounting the regulator on the "hot" side of the TEG? In theory, over 10 watts can be pumped back into the TEG.
>
> I'm wondering if this can effectively bootstap the process. Cold running water is typically available out in the wilderness. Put the cold side heatsink into the running water and electricity should be produced though maybe not a lot at first. If this is disapated directly into the hot side of the TEG by a power transistor, it should start to warm up, making a larger temperature differental, making more juice and so on until some equalibrium is reached. Shades of perpertual motion :-)
>
> Another question is will there be enough surplus energy left over to do the charging? Yet other question is if the process has to be started by first heating up the hot side and if it would then remain self-substaining?
>
> But if that doesn't work, plan B is to get a little backpackable wood stove and use that as the heat source. I'm looking at one made of titanium plates which lock together to make

a box. Since this stove has flat sides, attaching the TEG to it would be simple.
>
> The advantage of Plan A is that if it works it could be left unattended all night to charge something. Plan B would require keeping a close eye on the wood stove, which goes through fuel quickly. Not a lot of fuel, but it burns up small sticks pretty fast.

It claims to be able to produce up to 15 V at 1 A, or 15 watts and at 3" x 3" x 0.5" is reasonably small. However, what kind of delta T it takes to produce 15W is not specified, I'll have to figure that out on my own.
>
> A TEG is made up of bimetalic semiconductor junctions wired in series/parallel. When placed between two metal plates (typcially aluminum), then heated on one side and cooled on the other, electricty is produced. These can also be use in reverse, putting current into them will cause one side to get cold and the other hot. This is known as the Peltier effect and is used for CPU cooling. However, I found out the coolers have all thier juncitons wired in parallel, so only produce a small voltage when used as a generator.
>
> My plan is to use the TEG to charge Li-ion batteries during extended hiking trips. It's easier to arrange for fire at night then sun during the day! But there is something I want to try. For charging batteries, I will only need 5 V at a few hundred ma. Since that will have to be regulated, why not take the "wasted" power and put it back into the generator by mounting the regulator on the "hot" side of the TEG? In theory, over 10 watts can be pumped back into the TEG.
>
> I'm wondering if this can effectively bootstap the process. Cold running water is typically available out in the wilderness. Put the cold side heatsink into the running water and electricity should be produced though maybe not a lot at first. If this is disapated directly into the hot side of the TEG by a power transistor, it should start to warm up, making a larger temperature differental, making more juice and so on until some equalibrium is reached. Shades of perpertual motion :-)
>
> Another question is will there be enough surplus energy left over to do the charging? Yet other question is if the process has to be started by first heating up the hot side and if it would then remain self-substaining?
>
> But if that doesn't work, plan B is to get a little backpackable wood stove and use that as the heat source. I'm looking at one made of titanium plates which lock together to make a box. Since this stove has flat sides, attaching the TEG to it would be simple.
>
> The advantage of Plan A is that if it works it could be left unattended all night to charge something. Plan B would require keeping a close eye on the wood stove, which goes

through fuel quickly. Not a lot of fuel, but it burns up small sticks pretty fast.

Stephen:

Have you found specs on the amount of power (voltage and current) the thermisters generate to power the radio? Transistor radios don't take nearly as much voltage or power these daze than did the radios which ran filaments and B+ for vacuum tubes. Still, for about $66 plus shipping, it might be a neat power supply for a novel transceiver. You might be able to charge a secondary cell or two so you could drain more power intermittently while transmitting.

Besides, one could operate nighttime without depleting the energy source!

I kind of liked the idea of folks sitting around the lantern, listening to the radio together. Reminded me of my childhood.

I didn't find any info on the thermopile's output. I have a few AM/FM radios that seem to operate on 3 VDC, and maybe less. If one needed a bit higher voltage, you could use a DC to DC converter? The lamp may not have enough capacity to power your rig directly, but if it trickle charged a battery, then you might be on the air.

8248. ATS-3b: Low output on 15 and 20m

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-02-03 00:30:22 UTC
From: Ben Pharr
Topic: 8248 Message: 8248

I'm finally getting around to aligning and testing the band modules for my ATS-3b. Most of them check out okay, but 20m is a little low and 15m is a lot low.

The 20m module shows 4.1W output at 12.0V. The turns are already spread around the toroids pretty evenly on LF1 and LF2. I'm thinking I should take a turn off LF1?

The 15m modules shows just 2.4W out at 12.0V. Ditto on the turns spread evenly. LF1 only has 11 turns on it. Would taking one turn off be enough?

Thanks for any suggestions. I'm looking forward to getting this thing on the air.

Thanks,
Ben

My toroids optimized with a lot of compression, not spreading.

Had a lot of fun adjusting the windings!

You might want to start with "ATS-3B Filter Module Details" by KX0R in the Files section. For 20M he recommends that LF1 be distributed evenly on the entire core (Open), but LF2 should be 'Medium' which seems to equate to half way between Open and Tight, which means the turns are all as close together as possible. So you might need to bunch up the turns on LF2 a bit?

Before I started changing the windings, I would make sure I had put on the correct number of turns in the first place. And the correct caps in place.

The significance is I only have a limited pallet to color parts with, so the same color has to used over in some cases. It should be obvious that the inductor is quite a different part then a capacitor, even though the same color is used to tell it apart from the same kind of part with a different value.

Well, unfortunately that is not going to be easy to do. You can't just hook up an encoder across the switches and expect it to work - it wouldn't. You need to add another microprocessor between the encoder and the switches in the rig. The extra processor has to determine the direction the encoder is turning and then "push" the approperate switch. It also has to ensure not pushing the switch too long to keep it from going into scan mode, but long enough that the switch closure is detected.

Anyway, I still don't understand why any one would what to change the most effective way to tune a radio in a small box like this anyway.

Steve KD1JV

From: Dale Putnam
Topic: 8258 Message: 8258

The Game Warden has graciously agreed to open the second half of the FoxHunt Season in the 80 acre woods.So tomorrow evening, which makes it at 0200z Wednesday, somewhere in the 80 acre woods (3560 +/- 10) you willmay find a pair of sly fox.. KZ5J and WC7S slinking around handing out pelts (Qs) to the deserving Hounds, (that would be you). We will attempt to find a clear spot, to howl at the moon, and we will be expecting answers as we announce.. usually up 1 or 2. Ok.. now.. seriously.. we have a lot of fun with these foxhunts and the fine details can be found easily onhttp://www.qrpfoxhunt.org/winter_rules.htm I will be using a K2, at 5 watts, with a switch selecting one of: a pair of verticals on a steel roof,a 90 ft center fed at 30 ft, or 3 - 360 foot center fed at 50 ft. 0200z Wed. on 3.560 +/- 10 or 7pm Mountain Time Tuesday evening Local time. Bring your best, and spread out a bit, Good luck, May the Prop goddessess smile on us all,

8259. Re: Tuner in a Altoids Tin??

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-02-06 14:12:52 UTC
From: cloud runner
Topic: 7457 Message: 8259

Hi Jake!

Well, I used the Tayloe SWR indicator kit from Hendricks, just as Hendricks used in the BLT+ kit. The skematic for the tuner is essentially similar to the BLT+ kit, but I used a smaller toroid, a T68-6, or it wouldn't fit in the tin. This seems adequate down through 40 meters. You can view those skematics by downloading the Hendricks manuals.

You can see the layout from the photo, and it is the layout that is key to building the tuner into an Altoids tin. Building into an Altoids tin is the key to making the tuner much lighter than the kit version offered by Hendricks. Potentially, you could buy the Hendricks kit, then build it into a different box. Most of the weight and size of his tuner is a result of the over-sized case.

Another hint. I wired up the toroid taps and the switch outside the box, then mounted it with leads going to other components.

8264. Calibration Problem....Any Suggestions?

Date: 2012-02-08 17:31:48 UTC
From: dahupmich
Topic: 8264 Message: 8264

1. I built the rig for 15/17/20/30/40 meters, using the modifications as directed.
2. Initial testing, the display showed the correct band frequencies when bands were selected. Also all the push button switches seemed to work okay.
3. Step one calibration I have 10,000,000 +/- a few HZ displayed on my frequency counter on TP1.

Now the problem

4. Going to the next step in see CAOS and 0000 Hz on the display BUT I can not get any reading for the BFO audio beat note frequency, with even tweaking CT1.
5. I've went back and checked and rechecked the soldering at each IC.
6. I've checked continuity from each pin to next component for all IC.
7. Crystals checked with my homemade crystal checker and all seem okay.
8. I've checked continuity from CT1 to X3 and X3 into U2, all seems in order.
9. I haven't gone past the BFO calibration step. I want this correct first.
10. One continuity check I'm having a problem with is on U8 pin 11 shows to ground, but I do not show ground as I get with pins 3, 6, 8 from that same IC U8.

Any suggestions?

8265. Second Half plus 3 weeks.

The Game Warden has graciously agreed to open the second half of the FoxHunt Season in the 80 acre woods (plus three weeks).
So tomorrow evening, which makes it at 0200z Friday, somewhere in the 40 acre woods (7040 +/- 10) you will
may find a pair of sly fox.. KZ5J and WC7S slinking around handing out pelts (Qs) to the deserving Hounds, (that would be you).
We will attempt to find a clear spot, to howl at the full moon, and we will be expecting answers as we announce.. usually up 1 or 2, or maybe down 1, 2, 3, 4, ... ??Listen well.. directions are to be expected. AND if there are no callers, no one being answered, insurance pelts are welcome.

Ok.. now.. seriously.. we have a lot of fun with these foxhunts and the fine details can be found easily on
http://www.qrpfoxhunt.org/winter_rules.htm

I will be using a K2, at 5 watts, with a switch selecting one of:
a pair of verticals on a steel roof,
a 90 ft center fed at 30 ft, or
3 - 360 foot center fed at 50 ft. The verticals or the long wires can be phased, so if the going gets tuff, and the answers are coming slow.. please call a couple times, but if the answers are fast, one call will do nicely.

0200z Wed. on 3.560 +/- 10 or 7pm Mountain Time Tuesday evening Local time.

Bring your best, and spread out a bit,
Good luck, May the Prop goddessess smile on us all,

--... ..---

Most (or all) of those who couldn't get a BFO frequency reading found bad solder connections on the audio amp. Make sure all the pins (except 8, power +5 and ground pin 4) have 2.5V on them. Also check the little transistor amp which drives the uP port is okay.

The BFO beat note should be good and loud, enough to make the AGC kick in. (we are talking a 4B here, right?) so the volume should start to level out and not increase after the volume control is about 1/2 way up.

nope.. the speed of tuning is a matter of the processor.

Hi all

Well sorry it took so long to get going but the ATS 4B is finished and worked right out of the gate. Thanks to Steven KD1JV for sending the 3.3 volt regulator a it makes the radio work much better!!

Hope to catch you all on the bands . . .

Cheers es 72 de

8272. NAQCC Sprint Tuesday night!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-02-11 17:45:22 UTC
From: NAQCC
Topic: 2905 Message: 8272

NAQCC Sprint Tuesday night!

Our February sprint is this coming Tuesday evening local time (Feb 14, EST - 8:30-10:30PM, CST - 7:30-9:30PM, MST - 6:30-8:30PM, PST - 5:30-7:30PM), which translates as Wednesday Feb 15, 0130-0330Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201202.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX. A Certificate for top score in the GAIN antenna category. Finally there is one more award - a certificate to the highest score from a first-time participant.

Prizes: A prize of a set of bug/paddle handles or a K1/K2 knob insert donated by master woodworker Gregg WB8LZG is awarded for each sprint to the winner of a random drawing among all participants. Previous winners are not eligible.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 5,880+ members in: All 50 States - 9 VE Provinces - 90 Countries. Just sign up on the NAQCC website (http://naqcc.info/) and you will receive a handsome certificate, with your membership number which is good for life. A great way to start the New Year!!

Come join us and have a real good time!

72/73 de Dave VA3RJ

Hi Johnny,

I made a mode to the radio and replaced all of the yellow C0G thru hole capacitors for the input filter and output filter and replaced them with SMT C0G equivelents . . . It works GREAT!! the radio is HOT and puts out a minimum of 4 watts on all bands. What a success story!!!

Cheers,

Mike Wyman

8276. ultra-lyte

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-02-14 15:53:59 UTC
From: pegasus
Topic: 8276 Message: 8276
Attachments: 1 described; binary payloads are missing from this source WARC

In the spirit that one idea leads to others, here are recent tweaks to my Ultra-Lyte trail radio system.

Tweaks to the EFHW tuner (by KI6J) ...

Overcame its reluctance to tune a 15 meter end-fed halfwave by disconnecting the smaller of the two varicon sections. This reduces the minimum capacitance putting 15 mtr within tuning range. A little fussing with the turns on the toroid and it tunes all design bands, 15 through 40, even without the 50 PF varicon section.

Created a male RCA jack from a plug and a 3/8 inch nut so that the tuner plugs directly into the ATS3B (or ATS4B) without an adaptor or intervening piece of coax. This reduces loss, weight and set up time.

The heart of the set-up is the ATS3B which has been carefully adjusted to optimize output. There is a sweet spot balancing the two toroids that achieves high output at low curren. I believe that I was seeing efficiencies of 80% and better if power drawn by the receiver and driver are subtracted from the total current.

At 12.1 volts (I generally operate at 11.5 volts)...

Band output Ammeter

80 5.0 W 630 mA
40 5.3 W 710 mA
30 5.6 W 790 mA
20 5.5 W 797 mA
17 4.9 W 716 mA
15 5.1 W 770 mA

On the DC end, I replaced the jack on the 3S LiPO batteries with Anderson powerpoles. They are more convenient and lighter than the stock 4 mm banana plugs. I rebuilt my voltage controller switch with powerpoles. It is simply a SPDT mini-toggle with center off plus diodes to use their voltage dropping characteristic. This provides three voltage levels, through 4 diodes for tuning up, one diode for operating when battery is fully charged to 12.5 volts, and straight through when battery is in its normal operating range of 11.1 to 11.6 volts.

Created an adaptor that goes from the ATS3B DC jack directly to powerpole eliminating a cable.

The vertical alignment attaches simply with rubber bands to the fishing pole EFHW antenna support. Here is what it looks like ready to be attached to the pole ...

Spring and trail running season comes soon!

Hi There

?

Well there isn't much difference except for some eye strain and placement adjustments.? The electronics of the filter is still the same.? It was just something different to do with the ATS4 and since it is my second one I wanted to try something unique.? It would seem to me if you are building an SMT (surface mount technology) board,?adding thru hole parts didn't appeal to me.? Otherwise the circuit is just the same.? It sure is neater on the board though . . .

?

?

Cheers,

?

Subject: [AT_Sprint] Iambic keying

I've been looking into the Iambic keying issue and decided the best way to find out the proper way for it to work would be to go back to the source which set the standard. That would be the Curtis 8044ABM chip. Google quickly found the original application note written by John Curtis himself. This is what it has to say about A and B modes:

For example, (iambic A mode) if you squeeze the key paddles, leading slightly with the thumb (dot paddle), you can easily produce the Morse "period", "di dah di dah di dah". Some other characters produced by releasing the squeeze earlier, are the "AR" (di dah di dah dit) or the "AA" (di dah di dah), the "R" (di dah dit) or the "A" (di dah). By starting the squeeze with a dash, we can produce characters like "N", "K" and "C". By squeezing during a letter, we can make other characters like "L", "Q" and so forth. Squeeze keying is fast and easy since it minimizes finger and wrist motion.

Type "B" iambic

The procedure described above is typical of what we call iambic type "A" or the original Curtis method. In type "B" iambic, a squeeze released during an element (dot or dash) will cause another alternate element to follow the one being produced.

For example, it you squeeze to produce a "period", then you must release during the third dit (or the space following). The last dah will automatically transmit. For another example, to make a "C", you must release during the second dah (or the space following) and the last dit will automatically transmit. Presumably, this further reduces the effort to produce some letters. But at high speeds, the necessity to release during the (very short) dit period may be difficult. The window for action on the "B" type is one-half that on the "A" type.

Okay, now we know how B mode is suppost to work. A squeeze released during an element will produce an opposite trailing element.

Therefore, in B mode, to send an A or N by squeezing both paddles requires releasing the paddles as soon as the first element starts sending. In order to avoid sending a K or R instead, you need to be really quick, so one should avoid squeeze keying for making A's or N's.

Both my keyer and the keyer in the Ten-Tec Argo V work as above, as does a K1EL keyer I have. However, the K1EL keyer seems to have slightly different timing. The paddles have to be squeezed farther into the dot or dash before they are released to get the alternate element to send then my keyer or the Ten-Tec does. I can see how that can help avoid mistakes at the higher speeds.

Okay, one last issue. A vs B. On closer inspection, it turns out there is basically no difference between A and B modes in my implementation. They are both B mode. I said I look for both paddles closed at any time to set the extra element flag, but that is not the case. It is only tested at the end of an element being sent. This condition is already effectively tested for during the sending of an element by looking to see if the other paddle is close and if it is, setting a flag to produce that element. Checking again for both paddles closed at the end of sending an element is redunent and is the only difference between A and B modes in my implementation. I always thought B mode was more difficult to code for, but it looks like A mode is more tricky.

I'll tweak the timing on setting the flag for opposite element generation for squeeze keying and see if that helps and try to see if I can do a proper A implentation which doesn't result in dropping elements instead.

Hi all,

Some people have asked me to post the pix of the radio in the photo section so I have. Note the modified band artwork for the switches. I need to take the radio apart to show the SMT filter components on the bottom of the board. This means de soldering the RF and power connectors so I will do that this weekend.

Enjoy

Well, that's great, but I can't make heads or tails out of PIC code. They do things in a way no one else does...

Steve
Steven,

You may already have seen this but if not, K1EL has published some of his keyer source code on his web site at http://k1el.tripod.com/freeware.html
It is Pic ASM code but he does a great job documenting.

I was looking at the schematic trying to follow the signal path. I see a connection from R12/S9-B labeled QSK in the filter section. Where exactly does that go? I see no other label to match it with on either the RX or TX schematics.

just curious.....

8286. Buttons Failing on ATS-3B

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-02-15 05:14:37 UTC
From: radio_kx0r
Topic: 8286 Message: 8286

I really like using my ATS-3B for portable work. I've used mine many times, from some great sites.

However, lately I'm having trouble with my frequency tuning buttons - they make contact sometimes, sometimes not, and they're getting worse. It seems to take a lot of pressure to get the buttons to make contact. They hurt my fingers.

This is a surprising problem, because my rig has mostly been kept in a very dry environment.

Has anyone else here had issues with the buttons on your ATS rig? Were you able to fix the buttons? Is there a recommended contact cleaner that you know works - not something you think might work...did you really use it and does it work? Did it keep working?

I don't really want to replace the buttons if there's a better answer.

Some cleaners can damage plastics, and some work better than others. Please answer if you actually know what to use.

Thanks

George Carey Fuller

The original push buttons on Steve's ATS-3b prototype are fine. But I damaged one with a soldering iron and the replaced switch is failing the same way.

I think the only way to fix it is to replace the switches. The switches are not all created equal.

I've had what I figured to be premature failure also, then.... I found that the switches are designed for sideways pressure, NOT directly down...Steve mentioned that... and it is true for the switches I've replaced with too. I had to relearn... "PushButton"... always had pushed straight... not these. That breaks them.

Carey :

What may give you some short term relief (until you can replace the buttons) is to try pushing them sideways rather than straight down. You may find that this helps to make a connection and it will certainly be easier be easier on the fingers.

Most of a keyer's operation is well known, except for some particular timing details that are only needed when actually implementing a keyer. I sent out an email (1/20/2012) with my findings based on the Accu-Keyer, an iambic B keyer circuit which I had loaded into a circuit simulator in order to study. In case it got lost in all the email activity I'll repeat the one paragraph from that email that best summarizes these iambic B timing details...

At any time while one element or its trailing space is active, a momentary input (however brief) on the opposite element's paddle will be queued and sent immediately after the current element and trailing space are done. Also...the paddle input for the current element and trailing space may be held until the instant just prior to the end of that trailing space and that element won't be repeated.

(Note that this implies interrupt driven inputs are best, however the algorithm for the keyer chip from http://vk1od.net/module/pik/pik.htm scans by polling every "2ms at 10WPM". Skip down to the Algorithm section on that web page.)

I've never thought to use a contact cleaner as I think the contacts are basically sealed under the little "blister" that is the dome of the switch. Basically the blister "oil cans" (flexes like the bottom of an old-time metal oil can with spout) to make contact then springs back. I'm not sure any contact cleaner can penetrate.

Hi all,

this is exactly solved in the kit offered here:

http://diy4fun.blogspot.com/2010/01/rotary-encoder-for-ats-transceiver.html

Easy to assy and works for the first time.

The connection between the ATS and encoder kit is done by flat cable and appropriate connectors. I am using the 9pins cannon as it is bullet proof using the screws to fix the cable in its position.

The encoder is perfect for home operation on the table where it will improve the tuning operation comfort. Easy tuning like big radios with tuning state and scanning indication is nice feature. Of course the kit is not used on portable where the most advantage of the rig is simplicity and t-shirt size with all-in-one basic functions.

Thank You Steve for excellent rig and great support.

(just QBSA reloading could be welcomed by thousands users I guess :)

The flat connector, "computer cable and connector" works great... and the angled connector, mounted on the side of the altoids tin, works fine, needs only a little protection while hauling it around.. to protect the pins.. but that is easy to do, with a slightly modified socket, snip the connections off the bottom and slip on the exposed pins, let the jack take the hits. The encoder goes in a nifty tin that Miroslav... or was it Petr.. made... that works very cool. With this set up.. the cable lets you put the radio... over ther... keep the encoder close.. and have more desk space for the key, and log book. Very nifty and spiffy.

a thought for Steve consider ...

* I sure do prefer Anderson powerpole DC jack to others. I like how it might slide out, not having to be unsoldered to dismantle the rig. I like how it can mate up with other things in the shack.

* The nature of the radio likes reduced voltage during tune up. How about a "tune" mode that automatically reduces input voltage to something like 9 volts. It could be done in any of several ways I think, and done so much smaller, simpler, and lighter than doing it with an outboard attachment.

* I NEVER use the present tune mode of "key down." Never. I much prefer to touch the dit paddle giving fifty percent duty cycle while tuning up. Suggest this in "tune" mode rather than key down, or, if others prefer a solid key down, a way for it to be optional.

The ultimate way of doing it; once "TUNE mode" is selected, voltage is reduced to 9 volts or less, and then, a touch of the dit paddle causes dits to be sent hands free until the dit paddle is touched again.

* I think part of the game plan is two band radio, bands operator chosen, built on the basic board. But plug-in itself isn't a problem, it is band changing in the field.

therefore, how about the band module continuing to plug-in, but a two band plug-in. this allows switched band changing in field operation. One might have more than one two-band plug-in module, say, a daytime plug-in of 15/20 and a night time plug-in of say, 40/80. that would be a truly versatile and convenient way to do it...

Fred, these are all good ideas, but unfortunetly, not practical to add.

1. I don't have any Anderson plugs, don't use them. In any event, from those I have seen others use, I belive they would be too big to build into an Altoids tin. The new Mountian topper will use a power jack which is not mounted to the board, so if you can figure out how to make the Anderson poles work, you have that option.

2. Reduced voltage for tune up mode would require adding an voltage regulator and a way to control it's output via the processor. There are no spare I/O ports to do the control, nor room to add an adjustable voltage regulator, or a place to duct the heat produced.

3. The Tune mode really isn't required, sending dits is usually all that is required, but being able to produce a steady carrier without going in to Straight key mode is handy on occasion and is needed if you have an autotuner (which is not really recommended) or what to check power output with a meter.

4. Band modules - I want to get away from using these for a couple of reasons. The main one being cost. In the quanities I buy boards in most of the cost is set up fees, so the band module boards each cost almost as much as the main board does. Then there are all the SIP pin and the socket which aren't cheap either. Spur suppresion is a little marginal with the plug in boards because the input and outputs are pretty close together, causing some "blow-by". Finally, there is the problem of people occasionally loosing a band module.

8300. ATS RX Performance

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-02-18 19:58:52 UTC
From: Lee Hiers
Topic: 8300 Message: 8300

Hello All,

I've got an ATS3B on the shelf of stuff to build, so I haven't had an opportunity to play with a finished rig yet. I've got an FT817 that is my main rig, but today in the ARRL DX contest I'm using a borrowed K3. Which *really
*makes me want to get a K3!

So, as I'm trying to work DX at 5 watts, I have a bit of time to ponder....and was wondering how the ATS3B would compare in RX performance to the FT817? I'm seriously thinking about selling the 817 and getting a K3, which would leave the ATS3B as my only portable rig (once I actually put it together!)...and I'm wondering if I'd miss it. Most of my activity is on 40 - 20 anyway, so I could probably do without the extra coverage in the 817...and I never work phone....

Has anyone compared the ATS rigs directly with the 817?

Back to the contest!

Lee:
*
*
*I can't compare the ATS rigs directly with the FT-817, but I can tell you that -- between my ATS-3A and '3B -- I have 162 DXCC entities worked, all at 9v and 3W (or less), and all while using an EFW which has never been strung higher than 15'. They are GREAT little rigs, and hold their own for DXing if you're willing to be patient, persistent and get facile with ATS split operation quirks. The ATS receivers are actually pretty hot and, for CW, probably hold a noticeable edge over the '817. *
*
*
*If you haven't yet spent some time operating an ATS-3-series rig, I guess I'd suggest you do so before making your ultimate decision. You may or may not like the "user interface" for day-to-day DXing. But, I can assure you that -- in terms of capabilities -- these rigs are more than up to the task.

I agree with Johnny, specs on both the 3 and 4.. compared to the 817... in a test condition...I think you would be hard pressed to present much measureable difference at all. IF you are considering using one in a heavy contest environment, like SS or similar conditions with a big antenna, and close neighbors pouring rf all over your rx... I'm not sure you would be pleased with any of them,although.. in a ligher test.. like 40 in the evening.. on an NS ladder night.. the little guys hold their own quite nicely.And on a mountain or hill top, in a casual operating condition.. again. you would be hard pressed to tell much difference,until you went to pack up.. and walk down the hill.... then the little guys stride way out front... both in weight, and in battery needed.The 817 can't work very well by being fed with a 9v battery... but the 3 and 4 will be quite happy for a surprising length of chat on a standard 9 v battery. Have a great day,

QSL, Steve. One other thought, then ...

I am presently reducing the voltage during tuning up with an outboard switch which inserts several (voltage dropping) diodes in series with the DC line. To do this,I need an input jack, an output jack, three diodes, a very small plastic box, and a small toggle switch which all together weighs one ounce. ain't much, but this is almost half as much as the entire ATS3B ;-)

whereas

three series surface mount diodes dropping the voltage about 2 volts, with one of those tiny slide switches that shorts them for full voltage after tuned up might fit on the board and weigh a few grams ???

73, FD - kt5x

At present for the ATS3B, I made an adaptor that goes from the DC jack to Anderson powerpole, weighs six grams and does the job very neatly. I don't think an Anderson powerpole is copasetic with an Altoids box because the metal is so thin.

Here it is: from the bottom up, the voltage controlling switch, the homebrew adaptor, then ATS3B and EFHW tuner. Everything is configured to be vertically mounted with rubber bands on a fish pole antenna support with rubber bands.

Subject: Re: [AT_Sprint] new ATS ... things I'd like to see

Fred, these are all good ideas, but unfortunetly, not practical to add.

1. I don't have any Anderson plugs, don't use them. In any event, from those I have seen others use, I belive they would be too big to build into an Altoids tin. The new Mountian topper will use a power jack which is not mounted to the board, so if you can figure out how to make the Anderson poles work, you have that option.

2. Reduced voltage for tune up mode would require adding an voltage regulator and a way to control it's output via the processor. There are no spare I/O ports to do the control, nor room to add an adjustable voltage regulator, or a place to duct the heat produced.

3. The Tune mode really isn't required, sending dits is usually all that is required, but being able to produce a steady carrier without going in to Straight key mode is handy on occasion and is needed if you have an autotuner (which is not really recommended) or what to check power output with a meter.

4. Band modules - I want to get away from using these for a couple of reasons. The main one being cost. In the quanities I buy boards in most of the cost is set up fees, so the band module boards each cost almost as much as the main board does. Then there are all the SIP pin and the socket which aren't cheap either. Spur suppresion is a little marginal with the plug in boards because the input and outputs are pretty close together, causing some "blow-by". Finally, there is the problem of people occasionally loosing a band module.

72, Steve KD1JV

a thought for Steve consider ...

* I sure do prefer Anderson powerpole DC jack to others. I like how it might slide out, not having to be unsoldered to dismantle the rig. I like how it can mate up with other things in the shack.

* The nature of the radio likes reduced voltage during tune up. How about a "tune" mode that automatically reduces input voltage to something like 9 volts. It could be done in any of several ways I think, and done so much smaller, simpler, and lighter than doing it with an outboard attachment.

* I NEVER use the present tune mode of "key down." Never. I much prefer to touch the dit paddle giving fifty percent duty cycle while tuning up. Suggest this in "tune" mode rather than key down, or, if others prefer a solid key down, a way for it to be optional.

The ultimate way of doing it; once "TUNE mode" is selected, voltage is reduced to 9 volts or less, and then, a touch of the dit paddle causes dits to be sent hands free until the dit paddle is touched again.

* I think part of the game plan is two band radio, bands operator chosen, built on the basic board. But plug-in itself isn't a problem, it is band changing in the field.

therefore, how about the band module continuing to plug-in, but a two band plug-in. this allows switched band changing in field operation. One might have more than one two-band plug-in module, say, a daytime plug-in of 15/20 and a night time plug-in of say, 40/80. that would be a truly versatile and convenient way to do it...

Can't imagine using the FT817 on 40 or 20 CW if you had an ATS3B at hand! The 817 has a w-i-d-e open front-end. YIKES! Any station on the band over S-9 will degrade what you hear, though an inexperienced op might think it was the other guy splattering!

73 Fred - kt5x

Hello All,

I've got an ATS3B on the shelf of stuff to build, so I haven't had an opportunity to play with a finished rig yet. I've got an FT817 that is my main rig, but today in the ARRL DX contest I'm using a borrowed K3. Which really makes me want to get a K3!

So, as I'm trying to work DX at 5 watts, I have a bit of time to ponder....and was wondering how the ATS3B would compare in RX performance to the FT817? I'm seriously thinking about selling the 817 and getting a K3, which would leave the ATS3B as my only portable rig (once I actually put it together!)...and I'm wondering if I'd miss it. Most of my activity is on 40 - 20 anyway, so I could probably do without the extra coverage in the 817...and I never work phone....

Has anyone compared the ATS rigs directly with the 817?

Wow Lee, this is a good point. I am a owner of few small portable radios, Elecraft and Yaesu FT817nd. Never mind to compare them on the lab to see which one perform better, but each radio has it own personality, if I can say this.

We can talk about this a lot, but whatever that I say is just my opinion or experience while operate them not the exact lab test.

Anyway, the ATS radios are the most portable and easy to operate while on the field, even with all of the known issues. The FT817 may manage better some (QRN) noises with 500 Hz CW filter and DSP addition than the ATS, but the original Steve setup and filters pass band for CW is very good. ATS selectivity is very good for portable use and casual normal use. For a "hard core" DX operation you need to look another way. I admit have logged few DX expedition with mine, but this is not the norm, neither the FT817 can.

For digital modes, FT817 is better, but needs an external decoder or computer. Never use one of the ATS this way. My ATS4 is the first generation and never even think on this. It is very important for me to control the splatter and I feel very uncomfortable having no adjustment for this with the ATS. I may be wrong, yes, but it is something I can manage with the Yaesu.

Which one is or perform better? Hard to say, without lab testing, but ATS radios rocks!

I hope this help you.

Best 73,
Milton NP4KT

Lee,
I have all three radios - the ATS-3B, the FT-817, and the K3. Also have the Red Hot 20 and the Red Hot 40 (similar to Norcal 20 and 40). Comparisons:

The K3 is the best by far. You know that.

The FT-817 is an amazing, versatile rig that does many things pretty well - but the receiver will overload on strong signals, and if you use it in a contest, with many high-power stations close by, you will experience extra stress. Strong signals de-sensitize the FT-817's RF and IF stages. The AGC also fights you.

You can improve the way the FT-817 works by using the front end attenuator, by using the IPO setting, and turning off the pre-amp. On the lower frequencies, with a large antenna, you don't want the extra gain that this receiver offers, and it does a better job with the IPO and the attenuator. I used mine for FD several years, and I did pretty well with it - but on 20M and 40M it was not as nice as on the upper bands. I have a 300 Hz crystal filter in mine, and I also use a SCAF-1 audio filter. The FT-817 has excessive audio hiss that needs to be cleaned up - both for CW and SSB.

Now I only use the K3 for FD, even though it's large and uses too much current for receiving. It's like night and day when the bands are busy with big signals. I have not used a KX3 yet...

The ATS-3B actually sounds nicer than the FT-817. The ATS-3B crystal filter is very sharp with steep skirts, and it does a good job of rejecting stations close by. The front end is about as strong as you can expect from an NE-602/SA-612 mixer. The current consumption would have to be increased to get much better overload/higher IP3 performance. The first mixer and IF would have to be improved, and this comes at great cost in current and PC board space. The front end filters are pretty good, which helps reject out-of band signals like short wave broadcast, etc., and using a tuner also improves out-of-band rejection. This is a well-balanced design for portable work. Even with no preamp, there is enough sensitivity for good performance on 15M. My ATS-3B will hear a few tenths of a microvolt on every band - but I did some extra work and measurements to make sure that all my receive filters were really peaked.

I also have a KX1, and the ATS rigs run rings around it. The KX1 doesn't have enough sensitivity or selectivity.

The Red-Hot radios have a +7 dbm double-balanced first mixer followed by a power transistor IF stage with considerable headroom. They eat a lot of current, but they really sound great. The design has a high IP3 and handles strong in-band signals well. The IF crystal filters also are nice. The audio is quiet, clean, and strong. These are nice receivers. Besides the power consumption issue, the VFO is free-running, and it drifts some - the tuning is non-linear - the VFO drift is not helped by the heat developed by the IF amplifier.

If you're goal is to do real portable work, requiring hiking and backpacking, the ATS rigs are what you need. The low weight and battery efficiency trump everything else. I've never actually taken my FT-817 out on a trail - the rig and a suitable battery weigh too much. Add a tuner, a real antenna, feedline, ropes, headphones, paddles, fishing pole - you're not enjoying the trip any more.

I carried my ATS-3B up to a ski cabin at 11,370 feet last month here in Colorado. We backpacked up there four miles, on skiis and snowshoes, through several feet of fresh powder snow. The rig, antenna, ropes, battery, tuner, accessories, and the fishing pole I need to deploy the antenna weighed 4 pounds. If the weight had been any greater, I would not have taken a radio on that trip. The air up there is thin, and I am not young. Radios like the FT-817 are out of the question.

I made plenty of QSO's at the high QTH, mostly on 20 and 15M. All were mini-ragchews, with plenty of content. I was on the air for hours, but I never ran my 2.2 AH lithium ion battery down.

The ATS rigs are the winners for the kind of operating where you need to carry the radio a considerable distance. There is a huge world out there, away from roads, where you can take a radio and enjoy the experience, but only a few radios are fun to take there.

Steve's tiny design is a real breakthrough.

Thanks Steve -

Carey

OK Carey - you have too many rigs! Not really...

The FT-817 is an amazing, versatile rig that does many things pretty well -
> but the receiver will overload on strong signals, and if you use it in a
> contest, with many high-power stations close by, you will experience extra
> stress. Strong signals de-sensitize the FT-817's RF and IF stages. The AGC
> also fights you.
>
Yes, I know that first-hand. I operated the 817 in Field Day, ARRL SS, and
CQWW last year as my only rig. Even with the preamp off and attenuator in,
the 80m band was a huge pain in SS especially.

Now I only use the K3 for FD, even though it's large and uses too much
> current for receiving. It's like night and day when the bands are busy with
> big signals. I have not used a KX3 yet...
>
If I have a K3 in time for FD, yes, it's going out with me, even if I have
to lug along another battery!

The ATS-3B actually sounds nicer than the FT-817.
>
That's good to know. I'll admit there were two main reasons I bought the
ATS-3B kit: first was the "neat-o" factor - having a good multi-band
transceiver in an Altoids tin. Second, it looks like the ideal rig to use
for the Spartan Sprints. I'm not much of a hiker, but have considered some
light SOTA activations, and the ATS would obviously be great for that.

All along however, I'd assumed that the '817 was a "better" rig - it's
comforting to hear that Steve's creation more than holds its own!

> The Red-Hot radios have a +7 dbm double-balanced first mixer followed by a
> power transistor IF stage with considerable headroom. They eat a lot of
> current, but they really sound great.
>
That's something to look at down the road too for fun...weren't they
talking about bringing out a 30m version?

Back to the original topic...it sounds like receiver-performance-wise, I
won't be giving anything up by getting rid of the FT817 in favor of the
ATS. I will say though, that the '817 does have a lot of other stuff going

for it and I wouldn't mind keeping it. Even with its problems, I've been very happy with the rig, making over 2k QSOs with it in the past year I've had it. I just don't know how much I'd use it if I had a K-3 and and ATS available. And it would make the acquisition of the K3 happen a little sooner...

Maybe I'll sell a guitar instead...

Thanks again, everyone!

For anyone who has more Internet experience than I do - I have a Marantz receiver, RC430, that I either lost the original owner's manual for, or one never arrived with it. Thus far, with a lot of head scratching and time looking, I did find "a service manual", but no owner's manual. Seems that the "vintage item" is so different that only a few were ever made, thus I'm between a rock and a hard place.

If anyone can reply directly to me at my email address with a hint of a solid lead to the paperwork, I'll appreciate it! This happens to be one of those "buyer beware" items that made it to eBay, then the seller disappeared. If it can't be used, I'll donate any sale of it to the American Cancer folks, to get some good out of it.

Thanks for the off topic bandwidth, kindly "reply to sender".

Gil,

Good luck finding a service diagram or schematic for one of these. I doubt they were ever available except maybe for an autherized service center.

What issues are you having with the stereo?

Of course, the first thing to do is clean all the controls and switches. That takes care of 90% of the problems. DW40 makes good contact cleaner, though you have to air it out for a while to get rid of the smell.

The most common problem is generally blown power amps. Fixing these usually requires replacing both the output transistors AND the drivers and any burnt resistors. I have a Maranz 2215 which would play okay for 10 mintues and then one channel would start to distort. Found one of the drivers was going bad when it got hot. Since left and right use identical circuits and the layout is usually pretty symetrical, if one side is working you can use that as a reference. When working on the power amp, I chech all the transistors and diodes with the diode test on my multi-meter, all the low value resistors and make sure none of the electrolytic caps are shorted. Open or dry caps are harder to find with out a ISR meter.

Another common problem is shorted electrolytic caps - which almost always seem to be 100 ufd ones bypassing low level stages. One should always check for bad solder joints, typically on parts in the power supply area which get hot.

If shipping weren't so expensive I'd fix it for you, but the cost of sending it back and forth would be much more then the thing is worth - dead or alive.

I agree with this; I just got back last night from a President's Day SoTA junket to Texas 2nd highest peak, Bush Mountain (W5/GU-002).

With 9 qts of water, my (synthetic) winter bag, tent, stove, etc, my pack was already 60 lbs. A heavier radio+battery would not have been welcome!

To me, the biggest drawback to the FT-817ND isn't the weight of the radio as much as the 250 mA that the thing pulls when it's squelched (with nothing coming out of the speaker). When the squelch opens and you actually hear a signal, the receive mode current rises to 450 mA. That makes it pretty much a non-starter for trips like the one I just took (at least to me; I'm not young any more).

The AT Sprint radios don't draw much more than that (about 600-700 mA) when they transmit!

The ATS is a very liberating radio, weight and particularly current-consumption wise.

If you can wait about a month, I should have the new 2 band Mountian Topper version ready for $100.

I got the prototype boards in last week (which had a number of mistakes which needed to be fixed, but that's why we spend to big bucks to have a few made). All that's left is to start buying parts and have the final version of the board made.

Hi Steve,

How is this rig shaping up specs-wise?? I could go for 40m and 20m though 30m would be nice. Will we be able to build our rig to customize the bands? I know this would require some changes in programming, but I could see buying two and building one for 40/20 and one for 30/20.

I also like the idea of off board connectors as this gives "me" more flexibility in how I build it into an enclosure. I have no real need for the LED digit as the CW annunciator works fine for me.

My primary use is for backpacking.

The ATS-4 rigs use a LM386 for the final audio amp, so they can drive a small speaker directly. The resonant CW speaker I show plans for in the -4 manual (and my web site) works very well, but it is a bit large for use out in the bush.

The ATS-3 and eariler series have a lower power audio amp, so using an amplifed speaker is recommended. Thankfully, there is a wide selection of small amplifed speakers available now for MP3 players.

The rig is just about ready to start producing (i.e., ordering the boards and parts and doing the manual). As invisioned, it will be dual band with slide switched filters, like on the ATS-4 and be all on one board. It still has the LED display, because there was no reason not to have it. Anyway, I for one like to have some visual feedback too.

A 40/20 version will be the "stock" bands, though I will probably allow you the option of using 30/20 instead since it doesn't cost much to include a few extra capacitor values. Parts for 80 M instead of 40 can be had by special request, mostly to keep my friends in Switzerland happy as they use that band for the yearly "Mountian day" contest.

To keep the current draw of the rig to an absolute minimum, I'm using a 40 MHz reference clock which limits the upper band to be no more than 20M.

I suppose I should take some pictures of the prototype board and post them here. Maybe later tonight.

Thank you. This helps a lot!

The MP3 resonant speakers are larger and heavier than the ATS3B itself, so I wouldn't go that route. I'll try a smallest speaker on the ATS4 and see if I can make that serve.

Steve: On the ATS3B ... I have put two Ipod heafones, each 32 ohms, in parallel using a tiny adapter, yielding a net of 16 ohms. That won't injure the ATS3B audio stage, will it?

tnx - fd

Fred,

I lucked into finding an old (10-15 years?) AT&T Auxiliary Speaker for use with mobile cellular phones 3040, 3050, 3440, 3450. It's 8 ohms, rated at 3W and made in Korea. It's in a 3"x 2"x1-1/2" black case and designed for dashboard mounting.

I researched last year for someone in the group but could not find a current reference to this speaker other than its phones are a long discontinued product. The speaker itself is not identified as a separate product.

The 8 ohm rating is probably one key to it's excellent performance. I'm sure the interior configuration of the speaker case also contributes. Used in my basement shack there is more than enough audio for listening across the room. I don't think it was ever tried outdoors.

Finally, this little speaker is a dud when used with my K2 which suggests the impedance is very compatible with the ATS3B.

Hope this helps.

Do you have an idea of how the weight of this rig would compare to an ATS3B
with 20 and 40 meter plugins? And you're talking Altoids-tin compatible,
right?

Hello Steve and group

I think that I am getting more excited waiting for the 'Mountain Topper" than I am for the KX3!

Just a point on the possibility of varying the bands - the two most useful bands for SOTA activations here in Europe are 30m and 40m - any chance that this combination might also be an option?

Keep up the good work.

Here in Canada, Radio Shack has become Circuit City: The Source. I bought a small MP3 player amp/speaker from them that is 2 1/2" x 1" x 1", and is powered by a single AAA battery. It has a built-in audio plug for plugging into your music player, so I also bought a 12" audio cable with an inline volume control.
http://reviews.thesource.ca/9026/1410078/centrios-centrios-portable-mini-speaker-for-ipod-mp3-players-reviews/reviews.htm

This has worked very well with my ATS3B.

Yes, it still fits into an Altoids tin and the weight should be about the same, maybe a couple of grams heavier.

Do you have an idea of how the weight of this rig would compare to an ATS3B with 20 and 40 meter plugins? And you're talking Altoids-tin compatible, right?

Sorry for all the trivial questions, but...

There will be three switches for bandswitching? And will they be
accessible from the outside of an Altoids tin, or must the box be opened
(the latter would be better as far as I'm concerned - fewer holes to cut in
an ornery tin!)?

Another might suggest punches. I don't have same, so ...

A trick with the tin ... I drilled a small hole for the switches, then took a nail set, and enlarged the hole by pushing the nail set in. The result is a very round hole with rounded edges.

For the square hole, I reported this trick once before, I drew the diagonals. Then drilled a small hole at the interesction. Then I used a tiny jelwer's saw to cut the diagnonals, then, and this is the key, folded the flaps back again making a rounded edge.

Sweet, looks like you can put the band switches on the other side of the board so that they are internal. Hmmmm, I just may go for two of these. Maybe 4 and treat them as single banders..... hmmmm, the possibilities.....

HI Steve,

I like the idea that the switches can be mounted on either side. I always mounted my swithces inside the case, except
the last ATS3b1 series with the LED display. I put my swithches inside so they would be protected.
You can see in my pictures the switches are inside, even the PSK Decoder are inside, without ever drilling holes
in the top covers.

From: John
Topic: 8344 Message: 8344

Steve:
I'm new to this list so I don't know of
your development plans or features for the MTR.
I'm looking for an ability to use the MTR
with an iPhone or Android device.
Do you see this as possible with your new
MTR design?

I'm open to adding interface circuits if needed.

The mobile device would run the equivalent of
FLDigi, PSKMail, etc., eventually. There is
lots of code around (I'm thinking of the new
CW code in the NEU-PSK modem) that could be
implemented on these devices.

Thanks,
John Hestenes, KJ6CVB

8345. ATS-4 .. will there be a re-run?

Hello Group,

I'm new to the group and I'm wondering if the ATS-4b is going to have another production run someday, or is Steve's Mountain Topper 2 bander a replacement for this?

I'd really like to have an ATS-4 to take backpacking, so guess I'm hoping there will be a re-run. Currently I have a lot of fun with his PFR-3 design.

I am not sure whether Steve supports digital modes with the MTR, but the earlier ATS designs supporting digital modes are only able to transmit using the PocketDigi software on Pocket PC, Windows Mobile phone or laptop.

The PocketDigi source code is freely available at www.sourceforge.net and you are free to port it to iPhone or Android if you have the skill and time. Or you may just use the code interfacing with the ATS transceiver and add it to an existing digital modes software.

For a brief description of the communication interface, see
http://www.kufr.cz/~ok1iak/HAM/ATS3a-digital/index.php3

PocketDigi was inspired by the MixW software and supports plenty of digital modes including CW.

Well, I guess I'll have to make more of the 4B's available at some point, but it will be a while, maybe early this coming winter. I'm taking mid May to September off to do some serious hiking and will be hard pressed to get the new MTR done and out the door by that time.

By all indications, it's about time I did a simple, inexpensive ultra-light rig and demand for that will be also high.

I'm still wavering as to keep the Pocketdigi interface in the MTR or not. I can't seem to quite trim the firmware down to under 4K so will still have to use a 8K chip. The cost difference is only about 50 cents, so not a big deal there. There is really no reason not to include the pocketdigi interface, except I wonder if anyone would actually use it or not?

I'm currently working with a stripped down version of the 3B.1 firmware. One of the changes I'm making is to how Split mode works. I've eliminated XIT since that is not a real useful function. I'm adding to the ability to toggle the receive frequency back to the transmit frequency quickly without loosing the RIT frequency so you can check if that frequency is still if clear or someone is calling you there. That should be handy if you find yourself in a pile up stituation at the top of a mountain.

Steve KD1JV

That's entirely right for my experiences. Another tinsy thought. While I have no interest or need for a rotating dial interface for the main tuning, the push buttons on this sort of a radio and in this service is better IMHO, I would use the RIT MUCH more, and more effectively, if it, just it, was a rotating dial with a spread of something like two to three khz total side to side. I can imagine it being a tiny pot and a tiny knob. If I could a) sweep quickly without fussing with buttons and menus, and b) know where it is at a glance, as opposed to trying to see if a dot is lit or not, and if it is, try to get it to cw enunciate where it is relative to my transmit fq, it would be a ton more useful in the heat of battle! As it is in the ATS3B I rarely use it because I have to keep turning it off to re-center it on the transmit FQ so that I know where it is, then turn it back on to tune someone calling me to the side.

Hi John, The tools changed a bit since the early 60s, now, I use a very light springed pair of tweezers, Cash Olson's solder paste, a cup warmer, and a source for hot air... (besides me talking.... cw doesn't do much hot air generation, and I don't do ssb)... like an embossing tool, or a hot air rework station. And some kind of container so they don't bounce, and fly too far away. It seems the little fellers bounce, fly, and are slippery and extremely nervous... taking all that into account, a very light amount of pressure, with pre positioned solder paste, will curtail a lot of the freedom they aspire to achieve. To pick out or choose a tweezer that is good, find one with a very light touch. The intention is to be able to feel the amount of pressure being put on the part, not masked by the pressure needed to overcome the strong spring. Surgical suppliers might be of help, Tech Tools might be too. Good Luck, and have a great day,

Steve:

When I hike I carry my iPhone or Android for several purposes already.

I plan to develop apps for both iPhone and Android smartphones
for a device like the MTR. They will be new native OS apps --
not PocketDigi and not using Pocket PC. If I understand it, the 2-band
MTR is potentially a good platform and I would rather build on it than
try other approaches.

The question in my last post was whether there will be an electronic
interface available in the MTR design for a wired external device
or whether there would be obvious tie-in points in the circuitry
to which I would be able to add my own circuitry on. I can add a
small daughter board to the Altoid design to handle the interface
(and perhaps some other processing capabilities, such as a DSP).

I recommend you have an 8K option --- very much worth my 50 cents.
I can code the interface to the external smartphone/device if there
is some room to do so. It would help me avoid adding it on a
daughter board.

I'm eager to buy one of your MTRs to gain experience and start
this development process. So I hope you finish it before you go
hiking so we can get the kits before summer.

Thanks,
John, KJ6CVB

My favorite surface mount tool is an old pair of tweezers, about 4.5 inches long. The tips are ground down thin, smoothed and squared on all sides. The grinding wheel converted a $1 pair of tweezers into a $60 pair of tweezers in a few minutes. Its easy to slide a part into position where the soldering tip is waiting for it. A paper or cloth painter's dropcloth on the floor and around the work area helps when something does go astray. Dollar Store reading glasses and a 10X lens are useful too.

My style of SMD construction is as Dale says below.

I don't use any pan or such to capture escaping parts. If you have a part spring away from you, you may not ever find it. But, I have had good luck with putting a piece from an old nylon stocking/pantyhose over the end of the vacuum cleaner pipe and sweeping the area. You will often see a part if it's still on your workbench, but it's on the floor and especially on carpeted areas then I find a benefit from the vacuum system.

Be sure you have a Doofus tool. I made mine with a coat hanger a safety pin, and a fishing weight.

I use a large cookie sheet as my work surface. Large conductive surface with small rolled up edges kept all the parts where they should be, drops remained within bounds and a cinch to see. The stainless steel surface handled the static question. Every now and then there was a strained looking fella staring back at me from below, much older than I am. Dunno who that was.

My favorite tool is a pair of surgical forcepts. I use them while others use tweezers. they have no spring tension, so I can be very gentle, and drops don't flip away. I don't close them, you understand, just use them like a pair of miniature pliers.

But my homebrew Doofus is the single most indespensible tool.

"I'm a Beginner," sung to the tune of "I'm a Believer ..." ;-)

>I plan to develop apps for both iPhone and Android smartphones

Well, the main question is how to get data in and out of the smartphones? The approch Vojtec took was to use the sound card capacity of PDA's and implemented an audio tone based modem to talk to the rig via a paddle jack port. I don't know if that approch is possible with a smartphone, since I don't own one nor ever plan to. The down side of the audio modem is it can be a bit tempermental to get it to work well.

The processor which will be in the MTR is a TI MSP430F2132, which includes a universal UART, capable of a number of serial protocalls, including IrDA, which might be a possibility. The UART ports are being used to drive the LED display segments, but that's not a problem.

At one point I tried to build a bluetooth transceiver into the Altoids case with the ATS-3B board. The bluetooth module I stripped out of a really cheap headset for use with a cell phone. It might have worked if the something in the bluetooth didn't radiate so much EMI it rendered the receiver in the rig useless. I didn't bother trying to figure out a way to build it into it's own shielded box.

Anyway, there are possibilities.

Steve, is there any way you can keep the UART ports free and track them
to some header pins. They would be useful for other things as well as
digi-modes. Things like loading the memories or setting frequencies.

As it is in the ATS3B I rarely use it because I have to keep turning it off to re-center it on the transmit FQ so that I know where it is, then turn it back on to tune someone calling me to the side.

The 3B flashes a "0" on the display when Rx and Tx are equal in split mode. Though there is no easy way to determine the amount of offset you have at a give point in time, or if your above or below the Tx frequency.

Maybe what I should do is make the top segment of the display light when your tuned above the Tx frequency and the bottom segment when below it. In addition to ennuciating the delta frequency with the AFA. Doing the AFA might be a little tricky, as I'm now using the menu button to toggle between RIT freq and Tx=Rx frequency, but I'll think about it.

As for a seperate RIT tuning control, that would not be easy to add, in fact, maybe impossible.

If one has ever used an Elecraft K2 with A/B vfo and split/normal mode that is exactly how my version of the ATS2/3x firmware works. Steve, feel free to use it if it helps. The only down side is that I do not have the digi mode code in my firmware as I don't quite get doing digi with a minimalist rig.

Thinking out loud here, and you know where that gets me.... but to continue, could the direction of the tuning button or selection of the up or down, lite either a dot or one of the segments, when going to rit? I would rather know what the freq of the rit is, rather than the diff. if the rx is at 033 and the offset is at 035... ok, that works for me.

☐I don't quite get doing digi with a minimalist rig☐

That☐s my case too. That means carrying extra gears and struggling with more connection wires. Not really my cup of tea. I☐m glad to see that the MT has no connectors on the PCB. Thanks to that I☐m thinking to make an all-in-one box : MT board, power unit (LIPO), battery discharge control, solar charger control, active audio filter, antenna, antenna matching unit, micro-paddle, micro str8 key. Every function being nicely internally connected as due so as to have no single external wire.

How many are using digi-mode on the ATS2 and ATS3?

Steve,

The RIT is fine as is for casual rag chewing. When it becomes a problem is in the heat of a SOTA pile-up. In that circumstance, three, four, maybe ten callers, I have seconds to do something with the RIT to make a station copiable, copy it, and respond. I don't want anything to annunciate as it would be untimely QRM.

A rotary is most convenient, quicker, visual and physical, but if it can't happen, then it can't.

The up and down buttons are not as convenient, but they can work. I just don't know where I am, and even the single dot is generally hard to see in the bright sun light (and given that I am generally sitting adjacent to the rig and have to turn my head to see the rig.

I have never seen the "O" on the digit when the RIT was engaged, but I may not have tuned across it. That is interesting. I'll fuss with it and look for it!Now, I wonder what else might be illuminated which might indicate that it is up or down, and perhaps some gist of by how much. It would be enough if just several clicks to either side were clearly knowable.

I don't know what segments can be programmed independently. So i am simply speculating, ... the left half of the "O" for down a little, then just an end vertical segment if down further, then just a dot on that side if further still, opposite for the other side. when far away little is lit except a dot on that side, but as get close now that side is illuminating more and more until at center the O, then the other side if keep on going, diminishing the farther one gets away until just a dot on that side.

You know better what can be done.

(to your other question, I, for one, have never attempted the digi-modes with the ATS3, and likely wouldn't. I am still interested in the daughter board talked about with the ATS4B that would screen on the LCD.

73 Fred - kt5x

I don't know if having A/B VFO's is any less confusing or easier to operate than simple RIT. The real trouble is simply the fact of having limited display abilities. RIT is mostly used just to fine tune a station who may not have come back close enough to copy clearly. I think maybe the best thing to do is to limit the RIT range to no more than say +/- 1500 Hz. On CW you don't want to stray too far from the Tx freq or your into someone elses QSO. Or have gone past several of them. Limiting the RIT range and having some indication of if your above or below the Tx freq should be good enough for 99% of the time and the other 1%? Well, there are limitations to a shirt pocket rig!

Nope, not a chance. Those ports are needed to drive LED display segments and there is not a square mm of board space left to mount even two header pins on. It's actually quite amazing all the required parts fit on the board! If you really want to gain access to the UART ports and rewrite the firmware to use them, that is possible, but is not a primary design goal for this rig.

Yes, I will be there this year. Hopefully I'll be a bit more coherant and perky than 2 years ago. I thought it was just the long bus ride to get there, the late nights and early mornings which was making me feel odd, but it turned out I was suffering from an infected liver abcess, which was just starting to make its presence apparent. A week later I was in the ER and lucky to still be alive.

I will of course be with Hendricks kits, pushing the through hole rigs and you will find me in the bar after things start to wind down.

If I have any MTR's left to bring, I will bring some. But since I will be traveling by bus to get there and will be leaving to go do some hiking in VA right after, I will be traveling light. Say, anyone here going to Dayton and will be passing near Wytheville, VA on the way home?

Along the lines of a hardware store being a play ground...you may find interesting "tweezers" (AKA "forceps") from Fine Science Tools: http://www.finescience.com/

After you recover from the sticker shock of some of the fine, high quality, forceps, check out the Student Instruments for cheaper tools. I'm suggesting this for ideas more than purchases. A cheap pair of forceps (metal or plastic) can be shaped with a grinding wheel (coarse), files, and sandpaper (fine). An O-ring over the end can be rolled up towards the tips to make a gentle self-closing tool.

John,

Always on my workbench is a roll of 3-M blue painters' masking tape (other kinds of tape will NOT do), obtainable at just about any hardware store. I have a two-inch wide roll, but perhaps one-inch wide will suit your SMD needs. From it cut a narrow strip transversely, center it and stick it on the top of a component (either SMD or through-hole), lift the component by the tape ends, transport it to its desired location on the circuit board, strap it accurately and firmly in place by pressing the tape ends to the board, or to components that already have been mounted on the board, solder and then remove the tape (which is re-usable multiple times).

If you want to move along faster, cut a dozen or so of these tape strips, write a component's identity on the smooth back side of each strip with a ball-point pen and stick them on the designated components. Lay these taped pieces out in a line corresponding to their positioning sequence and proceed as I've indicated above.

It doesn't get any simpler than that!

Steven,

I don't own one of your rig yet and I am no specialist in ergonomic.
However, from what I understand but not knowing what is actually possible or not, this is what I would try to do starting from a blank page :
- only implementing RIT
- if no shift, then when TX the display (8 segments LED I think) shows 0 or = (two lowers horizontal bars)
- if positive RIT shift, when TX the display shows blinking and alternating U and the number of KHz for the shift (up to 9)
- if negative RIT shift, when TX the display shows blinking and alternating d and the number of KHz for the shift.

I agree you don't need a precise indication of where you listen, but knowing you are "not to far" is interesting. People just wanting to adjust the tone of the received station will now that they don't have to go further than "1" and people wanting to work split will now if they are just "UP 2" or much further...

I know that in order to keep things usable for day to day operation you have to keep simple. My own taste is that without any RIT/SPLIT it would be ok for the style of operation I am intenting in QRP.

By the way, you can count with me for one MTR. However I hope I will not be insulting using it as a "Coconut Top Rig" or "Rice Crop Rig" since I am just planning to do occasional QRP from my in-laws farm...

Thanks for listening to the owners or at list future owners comments.

Steve,
As an aside. I used the RIT in anger yesterday on the ATS4 (what a fantastic rig!), and was glad that I could glance down at the shift in between QSO's.

http://youtu.be/HKSE1PZa058

One thing that's started to bug me, unintentionally, is my use of the up/down shift switches.

I discovered early on that these switches work best as toggle switches, not push switches. I now have got into the habit of pulling back on one switch to go down, and pushing forward to go up. Of course that doesn't work. The frequency changes in the direction of the switch function, not which way you push or pull it!
I'd love to have the up/down function on one single switch and actually wonder if those little switches are DPST and could already do that without too much modification. It's something I would mod on my MTR if I'm lucky enough to bag one :-)

Thanks Steve. I'll monitor the group and look forward to hearing of the return of the 4B's at some time in the future.

I'll be hiking and camping in the Australian outback June through August. I'm taking your PFR-3 design with me, along with some half-wave endfed wires. Should be fun.

Enjoy your hiking trip!

73,

John

John,
I have decided (while probably not necessary) to use a miniscule amount of paste flux applied to the pads prior to "tinning" the first pad.I have had great success in using a match stick/toothpick with a dab of paste flux on the tip to grab and place parts; no pressure via tweezers to make it zing. It will be alcohol washed of with the rest of the remaining flux on the pcb. The problem I had at first is flipping the cardboard while peeling the plastic exposing the part. I have lost only one cap before I "lernt". You guys'talk on taking it (4b)on skiing expeditions and SOTA jaunts makes my mouth water. Tim

From: Tom
Topic: 8384 Message: 8384

I have just finished building 4 different SoftRocks and am anxiously looking forward to building a couple of the MTN rigs and have a few questions.
1. Looking at the pictures of Steve's build, I'm wondering if most of you will build using soldering iron and tack down each component individually, or do most use reflow methods?
2. If using a soldering iron with these size parts (most of the SoftRocks used larger parts) is it possible / helpful / recommended / not recommended to initially use a little solder paste and iron to tack down the first side of the part rather than lightly tin one pad, position the part, and reflow it?
3. Although I "get" the utility and low cost of using an Altoids tin for the enclosure, I for one would gladly pay for a more robust enclosure purposely designed for this rig. Is there any broad desire for a different enclosure, or is anyone planning to offer one?
Can't wait to get one or more of these in my hands! Hoping to do some SOTA this summer.

Kester 60/40 .015 solder rosin-core (perfect for SMD work) for sale - I have way more than I will use in my lifetime - will sell 3oz. coils for $10 (including postage) shipped anywhere in the US (1st class mail). Probably have 6-8 coils I can sell - this is a very small diameter solder.

Please email me directly.

Thanks much

Dan - KI4YZE

Mint tins are fine for me. My ATS3B looks like it's travelled a lot in a back pack, but it works just fine.

Because it is so much faster/easier I use the solder paste, embossing heat gun method. The only use I have for the iron is when I am troubleshooting and want to be sure that all connections are good. A quick, hot iron does that.

Hi Tom,

I am a very avid builder. I have also built loads of SoftRocks, MOBO, Sprints, Altoids Amps, and
Juma RXTX2, Juma Amps, all SMD, just way too many to list.
I only build by hand soldering everything. I like the way my soldering joints look after I clean and polish
everything that was soldered. I have control of my part alignment. I try to get each part aligned exactly.
Just the way I have done it, not that it is right but, is my way.
As for the enclosure have you looked at the American Morse? They are out of stock as of right now
http://americanmorse.com/
but I hope with the release of the latest rig, Doug will get them back soon..
I have put a couple of pictures in my folder, one is a Sprint 3b1 in an American Morse enclosure, and
you can see how it comes out hand soldered,

Good luck and enjoy your build,
Chuck Nolin

1. Looking at the pictures of Steve's build, I'm wondering if most of you will build using soldering iron and tack down each component individually, or do most use reflow methods?

I ran out of solder paste, so the board you see in the photo was all hand soldered. I supply enough 0.015" solder for all the SMT parts and will likely include a few inches of solder wick with this kit to clean up the shorts on the leads of the DDS chip and now the processor too.

3. Although I "get" the utility and low cost of using an Altoids tin for the enclosure, I for one would gladly pay for a more robust enclosure purposely designed for this rig. Is there any broad desire for a different enclosure, or is anyone planning to offer one?

The tin is actually quite robust and if you look through the photo section of the group, you can see a lot of guys have customized thier tins quite nicely. I have been thinking of eventually having a case made and I'm sure most everyone would get one. Not supplying the case with the kit is a little risky, as it is possible to get stuck with a lot of unsold cases.

One reason for not supplying a case right now is I got a message from Ten-Tec a few weeks ago saying if I wanted more ATS-4 cases made in time to take to Dayton, I'd have to do it right away since thier sheet metal shop was getting back logged. Having a new case made takes a month longer, as they have to produce drawings and make the punches.

Steve KD1JV

Steve;

While I'm thinking my way through a renovation of both "shacks" here on my gritty sand island, the thought crossed my mind about two factors which are the main ones with this type of kit. One is the size dilemma, where we encounter jeweler's headache physical problems in sheer handling of the parts. A sneeze can cause huge problems, along with all the other instances in which Murphy can cause a micro-part to disappear. The other problem is of cost, not just paying for a part that went someplace else, but also takes quite awhile to find a source for it. In order to reduce most of these irritations, the government has had a long term program going at its different labs in which the person who assembles the given device does so in a chamber that surrounds the work area, and there is all but zero air flow or other chance of a gust of air to disturb the tiny parts.
My sister worked in a couple of those little places during the course of her career, and the tales she tells of being ultra careful are

a bit incredible. Essentially, whenever anyone worked in a transparent enclosure, the first rule is patience, the second one is "place the part carefully". Her co-workers were glad when they finished with their projects, involving the idea of using magnifying lenses where needed, at least one barrier for the immediate area of parts, and slanted sides for the higher section, to make a "flying part" easier to find and pick up.

As I figure out what system will work best, I plan to have plain ole computer exhaust fans going, to take heat and fumes out, but not contribute to vibration.

The Altoids tin is neat and attractive, but has the little problem of not being robust, "take a fall and not become an interesting item to look at". The cases that you had Ten-Tec make are within 90% of what I envision as being needed, so stick to that avenue and maybe we can all get different ideas of "shirt pocket radio" for whatever band is open and active.
I rather expect to have visitors walk into my "kit area" in this one cabin, ask what the thin, transparent plastic sheeting is about, then I can enjoy boring them right out of the room - unless they want to watch something exotic in action, maybe get bit by the "ham bug'!

Hi Steve!

If you do mind a request, I would like to purchase a Mountain Topper at the Four Days in May.... 40 and 20 meters would be perfect and I will be at Dayton this year as I have already paid for a motel and have a seat in the van! Seventh year in a row for me but this will be my third at the Four Days in May!

Not being robust is not really a problem. Sure, you don't want to step on it or drop a big rock on it, but that goes for any rig. Especially those with protruding knobs. The problem is that some can't or don't want to do the rework of the tin. It can be difficult to do a neat job if you don't have a drill press.

It's a real quandry. Some would like a painted and silk screened case, others get a kick out of having a rig in an Altoids tin. And being able to make it unique has a certian appeal. Otherwise, it looks just like everyone elses.

I guess eventually a custom case will have to be made, but not right away. Not enough time and too much else to do.

There are other tins around that are robust enough to handle the most of the ruff handling and abuse that is handed out to a "pack" radio. However, even in saddle bags, I've not had any particular trouble with the altoids tins, either the one with the radio.. or the one with the filters. Now, I don't let my horses step on one either. But there are cases around that would let me do that.. I have no idea why I would want to tho. I'm more concerned with water damage. But even that can be managed. Some may recall, I did make one that is water proof.. or at least water resistant. Submersable, for a period. no, not real deep, either.. but then, I don't figure I want to install the antenna to work undewater either. So the occasional splashis managable. Ordinary care, and I've found the altoids does just fine. Now.. the antenna and tuner, that got drug behind the horse...that is a completely different deal.. and another story.

Hi Tom,

I forgot to mention in my previous post.

I really like the Altoids tins. I have shopped around and find the Limited editions and the Special tins. In the pictures you can see what I do to my tins to make them supper strong. I put a strip of aircraft aluminum around the inside of the tin to beef up the sides, so when you put the coax connector on and the bending and twisting won't move on mine. This way there won't be any flexing and allow the antenna or any other lead to flex and break. I never drill or damage the lids if possible.
I usually paint the bottom half, and keep the limited edition tops clean.
I also put sticky backed felt on the inside of my tins, to insulate an to look clean. The felt that I use is a Honda product and is expensive.
You can do your tins to your liking and it will do the job very well, for many years.

Good Luck,
Chuck Nolin

Dale, Steve;

This is one of those rare times in our hobby history when the enclosure is figured out a long time after the circuit has had a final polish put on it. I'll bet that enough builders get to know what they have going to know what button, knob, etc., does its job, then get a good idea of what to put it in for ease of operation. Just being able to put a really good rig in your pocket, "listen to with no problem", or string out enough wire to make contact with is the dream of the really old timers.
My first Elmer, Dr. J. Towne Conover, looked at my face one day, noted that I was aglow over "glowy tubes", and took my admiration of the tech at the time down a notch. His words are still with me, "The ideal will be to put a whole station, transmitter and receiver, into your shirt pocket and just attach it to a nice battery, hear and make contact with others with such tiny power output that you won't believe he or she is living on the East coast, while another operator is in Canada". He had a really nice Johnson rig at the time, kept it going until he got so old that a stroke caught up with him, then he still hung on to CW until he couldn't handle a key anymore.

Dale - a thought.... get the gears turning in your head, and figger out how to put a big part of an ATS in the base of a Vibroplex key! Somehow, I can envision a rig set up in the top cover of my big paddle key, maybe a straight key. The only problem is to make that antenna easy to set up, & that can involve a different company that is well known - but the wind can do some big damage to it, too.

Food for thought, that's what keeps this hobby the best, and we're handy when some "official' finds out that the power is out, people are hurt and hungry - and the baby needs diapers!

Steve:

The connection between the MTR any my iPhone 4S will be made using its 30-pin connector. You can get cables from an Apple-certified third party that implement RS232 in/out through the 30-pin connector. Apple-certification implements a key check (a resistance combination)
by the iPhone of the device connector to confirm that it is an approved connection device. So you fool the iPhone into confirming you are certified by using the third party cable!

So I would use a UART port on the MTR, if available. If it is not available I would build a daughter board and add some code to implement it.

Acoustic coupling could be done but I don't favor that. The audio in/out is best for the human operator. Many have demonstrated acoustic coupling success however (e.g. NBEMS FLDigi users). Acoustic coupling of the incoming and outgoing signal also does not solve issues of digital control of the interface.

Blue tooth could be done but it drains the battery more than I like so I don't plan to use it unless it is for a rarely used standard device (a BT keyboard, for instance).

IPad coupling has been demonstrated by using the camera adapter which provides a USB port. Using a powered hub (or equivalent circuit) you can connect any other USB device (e.g, some have connected a Signalink USB this way).
I'm not sure yet that this method works with the iPhone but the IOS 5 is the same for both devices so it needs to be verified. (I use an iPhone 4s with IOS 5.)

Android coupling can be achieved by serial signals in the USB port. Although acoustic coupling and blue tooth are options. There are other possibilities I believe for some devices with add-on adapters.

Steve:

I understand your design goal for this rig. You are right to keep to them
for this effort, especially in light of the short time before you go hiking.

If all the UART ports are committed the drive the LED display segments
I will consider the possibility of my adding code and circuits
on a daughter board to switch between the LED and an external
smartphone (using RS232 protocols) which can display the
equivalent information. This should not require modification of
your current PCB design, I think. The LED would connect to the
daughter board when the rig is assembled. The LED would be the
default choice of the switch. Such an approach
might also be used for other things, as the inquirer (below) asks.

So, at least, use an 8K processor so there is room to add code.

I appreciate your comments.

Thanks,
John Hestenes KJ6CVB

> digi-modes. Things like loading the memories or setting frequencies.

Nope, not a chance. Those ports are needed to drive LED display segments
and there is not a square mm of board space left to mount even two header
pins on. It's actually quite amazing all the required parts fit on the
board! If you really want to gain access to the UART ports and rewrite the
firmware to use them, that is possible, but is not a primary design goal
for this rig.

8401. MTR Audio Low Pass Filter

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-02-26 20:28:53 UTC
From: WA0ITP
Topic: 8401 Message: 8401

I'm really looking forward to using this rig in my portable ops. I love these little things.

Steve, would it be possible to call out an option for the builder to build in an audio low pass rather than the bandpass?

The only "unperfect" thought I've ever had about my ATS3(no suffix) is that the audio was often "buzzy" when a station was fairly well centered in the passband. There were some times that actually helped copy, but it was/is quite raspy on the ears.

Thanx for considering es cu at FDIM

Back to the bench, Winter's too valuable to waste.
I love this radio stuff !

Hi John.

It seems you are trying to reinvent the wheel with the serial interface. I spent a considerable time around 2007 to rethink various possibilities of connecting a handheld computer to the ATS transceiver. You can roughly sort the available interfaces into synchronous and asynchronous types, where synchronous means, the ATS firmware receives a command and immediately converts it to a transmit action like key down/up, frequency or phase change. With the asynchronous interface the ATS firmware has to buffer data and do the transmit timing on its own. The asynchronous interface requires therefore more firmware code and available controller RAM to transmit correctly. Complexity on the phone side is not an issue, but complexity on the ATS side is.

Now back to the interfaces available on modern handheld computers. Your software will talk to the device driver using a multitasking operating system, which will introduce heavy timing jitter into when the data is received by the ATS firmware compared to when it is passed to the operating system by your phone software. The timing jitter will be even worse if sent over USB. While such interfacing is possible with the ATS transceiver, your add-on firmware will be complex and will likely require stripping down the standard firmware features to fit your add-on. When transmitting a longer sequence you will have to communicate from your phone application with the ATS add-on to keep the ATS buffers not underfilled and not overfilled, which adds another level of complexity, difficult to implement on the ATS controller.

With the serial interface, you need a custom fragile cable, which may be expensive in case of iPhone accessories. IRDA is no more available. Bluetooth serial is power hog and has the same or worse timing issues as plain serial.

With the modem over sound output, you just need a single audio cable to connect to the ATS radio. The connectors are readily available and sturdy. The transmit modulation commands are modulated synchronously, there is no buffering on the ATS side. When the firmware decodes a command, it processes it and forgets it. All is simple and transparent, the firmware is small, already implemented and well tested.

> I plan to develop apps for both iPhone and Android smartphones
> for a device like the MTR. They will be new native OS apps --
> not PocketDigi and not using Pocket PC.

All I propose is to use the command over sound code from PocketDigi to develop your iOS or Android software. Maybe I will use your code after all as the Pocket PC platform is dead and I have neither time nor desire to port PocketDigi to a modern platform. I did it once (PocketDigi is an optimized port of Linux gMFSK application) and I know how time consuming it is to implement such an application and to learn a new development platform. BTW, PocketDigi is a highly optimized C code, which does not use floating point arithmetics and runs very well on a 200MHz StrongArm. 5 years ago the StrongARM processors were not equipped with FPUs.

If you really need to get to the serial port and still keep the display functional, I recommend to add a shift register between the display and a MCU. This will make 6 of 8 pins free for your purposes.

Here are the pictures of my modded ATS-3b:
http://kufr.cz/~ok1iak/HAM/ATS3b/photos/

The shift register is in the middle of
http://kufr.cz/~ok1iak/HAM/ATS3b/photos/pcb-top.JPG

and the general description of my modifications:
http://kufr.cz/~ok1iak/HAM/ATS3b/

You will find my modified ATS-3b firmware, which drives the shift register at the PocketDigi project on www.sourceforge.net

Hello Group

I just started having this problem with my ATS3a, I was wondering if anyone in the group could help me. Bare in mind I am not the sharpest tool in the shed!

THE PROBLEM: Upon power up the rig announces the start freq and than goes into transmit.

If a keyer is plugged in, the rig continuously sends dits.

If a straight key is in place than the radio sends a constant carrier.

Any ideas as to what is going on here? Has anybody experienced this on their ATS-3A The only way to stop the above is to off the power. Removing the keys has no affect.

Any suggestions?

Tnx

Walter KA2CAQ

Yes it will be programmable in circuit but not with JTAG. It will use Spy-Bi-Wire for incircuit programming.

Yes, this chip uses the two wire "bi-spy" interface. A USB based programmer called "the Launchpad" is available from TI and other venders for USD 5.00 - can't beat that price and since it uses a USB interface, will work with new PC's and laptops. The Launchpad is ment for the new "MSP430G series "value line" chips, but does work with the MSP430F2xxx series chip the MTR uses. However, TI says that might change in future releases of the board.

Steve, would it be possible to call out an option for the builder to build in an audio low pass rather than the bandpass?

No, that is a completely different topology and componet values. Anyway the BPF works better.

The only "unperfect" thought I've ever had about my ATS3(no suffix) is that the audio was often "buzzy"

That is actually a problem with the first audio stage and is usually most apparent with weak signals. Adding a 470 pf cap across the 330K resistor which connects to pin 3 of the LM4808 will solve the problem. That balances the cap which is across the feedback resistor. Another mod which might help is to remove the two caps which by pass the output of the product detector to ground (pins 4+5), then place one of the caps between pins 4+5 instead. This also helps improve the balance.

These mods could benifit all interations the 3 series rigs and have already been done in the 4's.

Actually, it wouldn't take any hardware changes. The UART ports drive LED segements. These will flash as the uart is working, but that is actually a feature to show that it is working. It's not like those ports have to stay in a specific state, like if they were used as an enable bit.

There will have to be some firmware overhead to switch the ports from the being connected to the UART or as normal output ports, but thats only a couple of instructions, but will have to be repeated everywhere the display is written too, which is actually a lot of places.

Dunno that I have heard the "buzzy-ness Terry refers to except maybe in certain headfones for which I was faulting the phone...

Pardon my ignorance ...

I am looking at the skematics of my ATS3B and my ATS4B and comparing to understand these mods.

* the 470 pf you say to put "across" the 330K (which I believe is R3 on the ATS3B skematic) ... but in the ATS4B skematic, there is a C23 470 pf cap from the pin 3 end of the 330K R3 to ground.

Q should it be across the resistor or from pin 3 to ground as shown in the ATS4B skematic?

* The two caps to remove are identified as C13 and C14 on the ATS3B skematic, removed and replaced by the cap identified as C13 on the ATS4B skematic.

Are these mods separately helpful, or should only be done together? I can do the second mod using one of the caps removed, but the other mod, I don't know if I have a 470 pf around or not. therefore, I wonder if it is OK to do the second mod and not the first for now, if that is of benefit...

Vojtech:

Thanks for your post. Looking at your links it is clear that you have considerable experience with the ATS-3B extension game. Your points are valid. When I get time I will study your approach in depth. The shift register is also a good idea.

My professional experience with microsecond-level real-time avionics synchronous data acquisition systems agrees with your main comments about multi-tasking OS-induced jitter and similar or related issues.

I still hope Steve will offer the 8K processor to allow space for some code.

Thanks again,

Yes, i will use 8K with will leave about 3K to play with. Unless I do put Pocketdigi back in, in which case there will not be much left.. But first I need to see if it still works in this new processor. There seems to be some suttle differences in how some things work inside it.

Steve

And again: Please offer the 8K chip to allow more code.

It doesn't matter much if the cap goes to ground or across the resistor. Doing the mod to the 3's, its easier to put it across the resistor. It was easier to put it to ground when laid out on the board.

The 470 pf mod will make the most difference. You can use a leaded part of course.

Steve

I am looking at the skematics of my ATS3B and my ATS4B and comparing to understand these mods.

* the 470 pf you say to put "across" the 330K (which I believe is R3 on the ATS3B skematic) ... but in the ATS4B skematic, there is a C23 470 pf cap from the pin 3 end of the 330K R3 to ground.

Q should it be across the resistor or from pin 3 to ground as shown in the ATS4B skematic?

* The two caps to remove are identified as C13 and C14 on the ATS3B skematic, removed and replaced by the cap identified as C13 on the ATS4B skematic.

Are these mods separately helpful, or should only be done together? I can do the second mod using one of the caps removed, but the other mod, I don't know if I have a 470 pf around or not. therefore, I wonder if it is OK to do the second mod and not the first for now, if that is of benefit...

73 fred - kt5x

The only "unperfect" thought I've ever had about my ATS3(no suffix) is that the audio was often "buzzy"

That is actually a problem with the first audio stage and is usually most apparent with weak signals. Adding a 470 pf cap across the 330K resistor which connects to pin 3 of the LM4808 will solve the problem. That balances the cap which is across the feedback resistor. Another mod which might help is to remove the two caps which by pass the output of the product detector to ground (pins 4+5), then place one of the caps between pins 4+5 instead. This also helps improve the balance.

These mods could benifit all interations the 3 series rigs and have already been done in the 4's.

Steve

Hi Steve and Michael,
mni tnx for your info - so it will be possible to change
a 40m/20m MTR to a 40m/30m MTR only by another firmware and
a few caps + inductors ..... no problem for a good homebrewer.
I believe 30m is a good alternate band on crowded contest weekends
for those who like a nice cw chat.

Actually, you will be able to make the band change simply by changing a resistor and the filters. 80 and 30 M parameters will be programmed into the chip, so I don't have to blast different firmware for those who want a different band mix.

Steve

Steve,

Just to clarify, it sounds like the MTR will have all the band parameters programmed in the MCU so that the resistor value will determine which bands will be used - is that the case? So the MTR will be capable of 80, 40, 30, and 20 depending upon filters and band-selection resistor? Any restrictions there, i.e., are all dual-band combinations possible?

Thanks,
72 - John - n0hj

All band combinations are possible. Parts for 40/30/20 will be supplied, pick any two. 80M on special request. Opps, I still need to see if I can use -2 cores on 20 instead of -4's. It would be nice to have only one type needed for all bands..though I suppose the yellow -4 could be used on 30. I'll have to see if it makes more sense to use less turns on 20 with a red core or more turns on 30 with a yellow core.

Steve:
 At the risk of being accused of tresion, I would like to suggest that your next iteration of ATS radios include SSB. I obviously have no idea who purchases your kits, but there seems to be a market of new hams who know nothing of the Morse Code.I have recently did 2 SOTA activations on SSB and find that I work better that twice as many contacts as I do on CW. I had the same faithful following plus more new contacts.
 This past Spring I spent two days sitting in a chair on the AT talking to "thru hikers" and playing radio with your 3B. Out of the group of possibly 5 "thru hikers" I did not see one "old geeser" type like myself. In the spirit of The Appalachian Trail please consider the larger audience that is actually using the AT and could benefit from the enjoyment of a radio which is smaller than a bred box and would work on SSB.

There is a reason no one sells SSB rig kits. Except for youkits from China - I have one on the bench that someone sent to me to finish building and to try and get working, haven't started on it yet because it looks like a project. And that's the reason, its a project and if you don't have a decent arry of test equipment - like a good Scope at the least, your going to have a real hard time getting it going.

My one foray into SSB rigs, the MMR-40 - which BTW hasn't sold very well - has been enough to convince me I really don't want to get into that can of worms making SSB rig kits. Too much to go wrong and way too big an investment to do right. Got 20 grand you want to give me to get started?

The youkit SSB sells for $350. No way I could compete with that. I'm happy to let them have the low end market and Elecraft the high end market. My nitch is little shirt pocket CW rigs and I'll stick to that. I have a hard enough time keeping up with demand for those.

Steve,

For the SoftRock RXTX KB9IYG had to face the same problem.
He supplies all the parts for all the possible band combinations.
You should have a look at the Bill Of Material :
http://www.wb5rvz.com/sdr/ensemble/00_bom.htm
and the band specific BoM
http://www.wb5rvz.com/sdr/ensemble/00_bom_40,%2030,%2020m.htm
Here you will find the assembly instructions for the LP filter :
http://www.wb5rvz.com/sdr/ensemble/05_rf.htm

I have built a Version 3 BitX kit (SSB only) without any special tool and use it on digimodes (18.000km with 3W in a dipole on 20m with JT65a).
However I agree with you that SSB is more tricky for kit builders and you should stick to CW only for the "ATS/MTR" series.
The BitX20A and now G6BLQ BitX have some success but looking at the Yahoo group one will quickly find out that it is not that easy to have everything right.

73,
Yan.

Topic: 8426 Message: 8426

I started ordering parts for the MTR yesterday. Today I got a message from Mouser saying the SO-8 LM386 audio amp is now a non-stocked item and I would have to buy 2000 of them for some $800 and wait 16 weeks to get any at all! They did have 48 left in stock which they sent me, but I need 102 more!

So, I just bought $4,000 worth of parts (to start) and can't use any of them because I can't get one 50 cent chip! Should I shoot my foot now or later? I really hate when they do things like this to me!

The good news is I haven't ordered the boards yet, so thats about $1,000 I won't have to throw away. Time to start looking for a subsitute.

Hope your day is going better...

Subject: [AT_Sprint] False alarm!

□
Well, it seems the LM386's I ordered were made by JRE, but Mouser and Digi-Key have 1000's of SMT LM386's in stock made by National Semi. Whew - the world is not coming to an end after all and I can proceed as planed.

It always seems the one part I don't check stock for before I order is always the one to give me trouble. Just because you bought something a few months ago,

doesn't mean you can still get it today!

Steve

8444. MTR pre-orders and other questions

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-02-29 17:23:58 UTC
From: Steven Weber
Topic: 8444 Message: 8444

Gang,

I've been getting a fair number of questions about taking pre-orders or reserving kits. If your one of these people, you'll notice I don't answer these questions.

My policy is I don't take pre-orders, pre-payments or make lists. It just increase the amount of work I have to do to keep track of it all, and commits me to making good on it. The time I have to spend doing all that is time I can't spend doing something else.

Then there is the ethical delema. Do I let a few people have preferental treatment by reserving kits or taking pre-payment from them? If I did that for a few, I would have to do it for all and that ends up no different then simply selling them when they are ready to go. I would rather wait to do that job when it's time to do that job, so it doesn't interfere with the jobs which have to be done first.

Finally, I wish I could supply more than a limited number of kits at one time, but I have to keep the volumes down to keep this looking like a hobby. As soon as it starts looking like a real buisness, things get much more complicated and we really don't want to go there...

Hi Steve

You've always made your policy very clear and I totally understand your reasons; Tony Parks takes the same stance with his hugely popular 'Softrock' kits. It is, of course, a huge compliment and a witness to the quality of your kits that we are all anxious to get our hands on one... or two, or three or more!

And here is my reason for writing: if the first batch is to be limited to 150 units, wouldn't it be only fair and reasonable guys if each of us limited ourselves to buying just the one kit until Steve has been able to satisfy the initial demand?

Just a thought...

I concur with you Richard, but of course it's a free market, and those that want to buy multiple kits probably will regardless.

I'd very much like the MTR but if I don't get lucky, at least I still have my very much loved ATS4! I know there are those on this list who are waiting patiently in the hope of picking up just one of Steve's rigs. I'm also pretty sure there are others who have many iterations of the ATS and probably a lot of unbuilt kits in people's "collections". I think Steve should work on an expiry mechanism along the lines of mission impossible;

"this kit is now 12 months old. Your mission is to either build it or donate to a worthy owner otherwise this kit will self destruct in...."

8452. ATS4 problem

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-03-02 01:19:46 UTC
From: bob_nelson_k2qpn
Topic: 8452 Message: 8452

Just finished my ATS4 (original). All the controls work fine. Calibration mode seemed to work except as noted below. I see three problems:

1. Calibration mode CAOS. Centering seems to work. But the BFO frequency counter stays at 0000. The tone changes when I adjust the BFO trimmer. I set the frequency using a counter on the audio output.

2. The receiver is deaf on all bands. A 1 uv signal is not audible. Stronger signals are audible and seem normal. Plenty of audio output.

3. No output from the transmitter on all bands - zero on the wattmeter. Nothing heard in a nearby receiver. Transmitter keys and the sidetone is OK.

Ideas??

73, Bob K2QPN

Either you don't have all the switches in the right positions or there is an open either on the input side or output side connecting to all the low pass filters.

From: radio_kx0r
Topic: 8429 Message: 8454

Steve,

You probably know this already, but others here may not - so here's what I do first when I'm looking for parts:

Purchasing Electronic Parts 101

Go to www.findchips.com

This is a free website that finds parts at distributors. If you type in a partial part number, such as: LM386 , you will see many different manufacturers' part numbers available, with links to the parts at several distributors. Then you can sort out the differences among the similar parts (case style, packaging, manufacturer, price, etc.), see where the stock is, and go to the distributor you choose to order from.

With a popular part like LM386 there are numerous choices, and choosing the right part(s) is not trivial.

Manufacturers use different suffixes for essentially equivalent parts, so often you must study the various data sheets - which you can via links in the distributor listings - to verify which parts from manufacturer "A" are equivalent to differently-named parts from manufacturer "B".

If you really know the exact, complete part number you want, you can type that into the Findchips search box and see just those parts and who has them....but do your homework first, or you might miss equivalent parts made by another manufacturer.

Findchips is extremely useful - it searches for capacitors, resistors, relays, etc. - all kinds of parts listed at distributors. The distributors provide this data so that WE can find and buy their parts !! We can save money and time by using this site to shop around. When doing a new design, it is useful to see what availability is like for a particular part. If there is little or no stock, it might be a red flag. Often Findchips will lead you to the popular, low-cost parts that the volume manufacturers are running with!!

Findchips isn't perfect - not all distributors participate, so you can't see all the stock out there. The Findchips data may not be quite as fresh as what's at the distributor's website, so if you're chasing a scarce part, you have to contact the distributor(s) to verify if the stock is really there, and you have to buy what you need fast before other buyers get to it.

There are numerous brokers who make a good living buying up scarce or obsolete parts and then selling them back once people realize they're almost gone.

If you really need a part that is obsolete or out-of-stock, using a trusted broker or "independent distributor" is often effective and well worth the price. These guys have very deep, powerful search tools that are not available to most of us, and they have networks of suppliers, often overseas.

If you're buying large quantities of parts, you can often get much better pricing from distributors than what they list on their websites. Just call them or email and and ask for a quote. They want your business. Prices can get better if they know you and you deal straight with them.

That's most of the game.

From: ok2mr
Topic: 8444 Message: 8455

Steve,

I am absolutely not against your policy for pre-orders and pre-payments, I know very well what does it mean with regards to administration, especially when handling such a small transactions and doing it as hobby in your free time. In different post on this forum we can see how complicated are tasks that must be completed by you, not only the design but whole manufacturing process, buying parts from various vendors. Recently I was putting together something really simple by myself and in the end I had to purchase parts from five different places. The only thing I ask you is to agree on a communication channel for letting people know that the kit is ready and the way you are going to take orders. If you agree that this forum is going to be the first communication channel and that you plan, somewhere in the future to post information that the kit is ready together with an email address for taking orders, it is absolutely fine in case that you will honor order of incoming messages with orders and some reasonable limit of let us say two to three kits per person. The advantage of doing this is another promotion of the forum itself as you can make sure that all interested parties will read it VERY carefully. Also it will ensure that everyone ordering the kit will be really interested in it at the time of order compared to the situation with pre-orders when one may pre-order something and actually lose interest in it during waiting for manufacture and delivery process. Internet is full of various distractions so it can happen very easily.

Good luck with kit preparation and manufacturing, I hope to be between those lucky ones to get one from the first production batch (taking the risk that the first batch might contain bugs as it happens even if you try really hard to avoid them).

Have a nice weekend,

Martin, OK2MR

8456. MTR progress

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-03-02 23:02:09 UTC
From: Steven
Topic: 8456 Message: 8456

The first box of parts arrived the other day, which was important since it contained the little SMT trimmer caps the board will be using. I needed to see these to make sure I had the proper pad spacing and part outline. With that comfermed, I can now order the final boards. These new trimmers are easier to adjust since they don't require a screw driver with a 1/64" tip.

I tested the Pocketdigi interface and that works and there is still pleanty of program memory space left over, so I will keep Pocketdigi digital modes in the rig.

I tested the transmitter using Red T30-2 cores for the 20 M LPF and got them to work fine. The spectral purity of this rig is very good, only a few spurs and none more than about -55 dBc.

My last little problem was getting the keyer memories to work. It turns out the new processor the MTR uses has four, 64 byte information memory blocks, instead of two 128 byte blocks the older processor used. This caused the old keyer memory routine to not work correctly.

Having four memory blocks is actually better. Three are used for the keyer memory and each of the three memories now has its own memory block. So now, instead of programming all three memories at once, they each can be individually programmed and if you want to change one, you don't have to redo them all.

The fourth memory block contains factory calibration data for the processor clock in it. My next task is to preserve that data and add to it when doing a frequency calibration of the rig.

So, we're moving right along with this project. A few more things to order and the manual to finish. I think I'm on track to start taking orders and start shipping before the end of the month.

Steve KD1JV

Steve,

Thanks for keeping us so well informed of the status on the MTR!

Is the price still looking to be around $100?

Randy

8459. Fwd: Panel Mount BNC Jack for ATS-4b

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-03-03 03:20:29 UTC
From: Rob Steenburgh
Topic: 8459 Message: 8459
Attachments: 3 described; binary payloads are missing from this source WARC

I was having trouble with an intermittent antenna connection at the RCA jack. I tried three different adapters (2 commercial and one home brew) and re-checked the jack itselft. Still no luck.

Since most of my QRP interconnects use BNC connectors, I decided to add one to the ATS-4b. Steve notes in the manual "It might be possible to replace the supplied RCA antenna jack with a BNC type by enlarging the hole, provided the new BNC jack has a short threaded section."

I couldn't find any BNC jacks with a short enough threaded section until I stumbled across the Amphenol 31-4237 at Newark.<http://www.newark.com/jsp/search/productdetail.jsp?SKU=94F155> It's pricey at $10, but I was willing to sacrifice a few other luxeries to give it a try. Turns out it worked great and provided just enough board clearance. No more intermittent connections.

During assembly, I also partially melted the power connector rendering it useless. I had been running the rig with a pigtail out the hole with a 2.1x 5.5 mm in-line jack. I ordered a replacement panel mount jack from Digikey (part no CP-011A-ND<http://search.digikey.com/scripts/DkSearch/dksus.dll?WT.z_header=search_go&lang=en&site=us&keywords=CP-011A-ND&x=10&y=17>) made by CU Inc. I had to do a bit of work with the Dremel to get it to fit, but not too much.

The nice thing about both these connectors is I can remove the entire board from the case without having to pull out the soldering iron.

Cheers,
Rob

From: William
Topic: 8460 Message: 8460

I admit I am a novice with regard to digital modes. I have had lots of fun on cw with my ats4 and would like to try it's digital capabilities.
I'm looking for a reasonably priced pocket PC for use with the pocketdigi program. Wifi or 3G capability would be a plus to allow internet access. What have you guys been using? What specs should I look for?

8461. ATS3 Band Module Connector Problem

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-03-03 19:33:17 UTC
From: Mike
Topic: 8461 Message: 8461

Hi,

My ATS3 has been having problems on 20 meters. Power sometimes drops out and, if I wiggle the band module, power output will vary from a few mW to full power. This only happens with the 20 meter band module so seems to be a problem with that module and not anything on the main board.

I've tried reflowing the solder on everything on the module - no help - so it looks like a problem with the mating of the module connector. I've done a lot of fiddling with pins 5 thru 7, bending them a bit in different ways for better contact, etc. This seems to help for a time but the problem reappears.

Does anyone have any suggestions on how to fix this? Anyone out there had a similar problem?

73,

Mike - ke5akl

Dale,

Tried Deoxit and it didn't help. It may come to replacing the module connector but was hoping someone might have had a similar problem and have a fix short of that. Pulling it off doesn't look like a lot of fun... :-)

If moving the module makes a difference I'd suspect a cracked track, or
maybe a fractured wire on a toroid.

Colin,

Yes, I've been wondering about a bad trace myself. The thing is it's not a purely on/off kind of thing. Wiggling it can change the power output to values throughout the range. It's an odd problem.

Given the results is a random output value, this would seem to rule out a bad trace. Since the LPF is two toroids and 4 caps (I am looking at the ATS3B schematic), and unless a lead on one toroid was never properly cleaned and tinned, I would suspect a capacitor. If one is cracked or shows other signs of a problem, then this might cause a variable that matches your symptoms.

From: radio_kx0r
Topic: 8461 Message: 8468

My guess it's a cracked ceramic capacitor, or a cracked connection, right where a lead solders to the ceramic chip under the epoxy coating.

Losing the cap would not make the power zero - instead it would just drop lower due to the imperfect match. Flexing the board might make it connect and disconnect.

Inspect everything with a very bright light and strong magnification. Any crack in the epoxy near the chip ends points to trouble. These small MC caps are delicate. A bad solder joint on a capacitor lead might have the same symptoms.

One way to find the problem would be to remove the module from the ATS rig, inject RF from a signal generator into the module's output, and connect a scope to the input - or vice-versa. Then probe each part physically to see if you can locate where the connection is intermittent. Whatever changes the level on the scope should be examined for the root cause.

It's not a good idea to run the ATS finals into this kind of bad load, even for tests. Keep the voltage below 7V if you persist.

Hope you find the problem!

From: radio_kx0r
Topic: 8401 Message: 8469

Steve,

I tried the 470 pf mod, adding a 470 pf cap across R3 on my ATS-3B, and I didn't really like it. I definitely got a change. With the 470 pf across R3, the treble was rolled off a bit, and while it sounded smoother, signals in the RF/audio passband, the onces we want to hear, lost some presence. I tried the mod with weak and strong signals, and I decided to leave the radio alone.

When I'm trying to work someone really weak, in a quiet location, I would have more trouble copying the guy if I did that mod on my ATS-3B.

I'd suggest testing the mod before doing it permanently.

I never tried the mod on the output of the product detector.

now, if that is of benefit...
>
>
> 73 fred - kt5x
>
> The only "unperfect" thought I've ever had about my ATS3(no suffix) is that the audio was often "buzzy"
>
> That is actually a problem with the first audio stage and is usually most apparent with weak signals. Adding a 470 pf cap across the 330K resistor which connects to pin 3 of the LM4808 will solve the problem. That balances the cap which is across the feedback resistor. Another mod which might help is to remove the two caps which by pass the output of the product detector to ground (pins 4+5), then place one of the caps between pins 4+5 instead. This also helps improve the balance.

With an intermittant at hand, in on a board that is small enough to fit in one's hand... the irresistible urge is to flex the board. And every time that occurs the increasing odds are that something is going to break. And much more often than not.. what breaks isn't the cause of the original intermittant. A very strong light... a bucket fullof patience, and a huge magnifier may be very helpful in sorting out what is broken. IF what is broken is visible. The wire has been known to break inside the covering of varnish, the caps have been known to break inside the insulation.. and the traces have been known to develop cracks in a manner that is invisible unless extreme magnification is used. Now.. this all sounds extremely daunting. So.. let's take a deep slow breath and discuss it. First. a reflow of the pins under the connetor of the board. I've had the hole through plating break, so the "hole through" connection, simply wasn't, and with only one side of the connector soldered, no connection from one side to the other existed. That can be found very quickly with an ohmmeter. and a TINY bit of pressure on the connector pins is all that is needed. ANY visible trace of rosin gives way to doubt as to clean, and if there is rosin left in sensitive places, that could be the issue.. again, easy to find, and cure. Soaking a filter in alcohol, will remove the most of it pretty easy. Then we get to the fun stuff, broken wire, see above, if you can't see it broken, then a GENTLE move of the toroid will reveal its secret, if there is one. NO need to pull, tug, or force it. The idea is to find the issue, not make more. Same with the caps, while watching the legs of the caps, GENTLY move the top of the cap a bit.. watch the leg for movement, if it doesn't move but the cap does.. consider swapping the cap.. if the insulation seal is broken and the movement seems to suggest that the cap is loose inside. Really a rare occurance, this one. OK.. caps, toroids, traces, connectors. Checked, visually, and reflowed if necessary. Replace the suspect parts, check it out.
NOW if there is still a problem. What causes the issue? Pressure applied where? And how much? Can you lessen the pressure applied, and localize the pressure into a toothpick sized area... that with the least amount of pressure "this" area is the most sensitive? Now you are down to finding the issue. No... flexing the board is not allowed.. we already discussed that. Unless you want to go do the first paragraph again, don't do it. Ok.. pressure here... on the "X". Does anything else cause the issue.. ? Heat? Use? Just being "on"? Let the filter tell you what it wants. Use all the conditions. Maybe it is just not happy with the 12+ volts? or is it just needing a long vacation? In that case, you may need to refer to para 1 again. Good luck, and if it continues, I have a solution... really do... send it to me, and let's see if a change of scenery affects a change. Sometimes, just being exposed to looking though a window at winds of 55MPH and temps in the 20s cause a rapid change of perspective.

Dale---thank you for a very useful reminder of what we should be looking for when plagued with an intermittant problem.

We all have these problems from time to time. My experience is that at least 80% of problems are solder related---others may difer.

Can I add an additional thought. Concentrate looking where the problem is likely to be. In other words use your trouble shooting skills and tools to determine what is working / not working when the intermittant is present. A good signal source for a receiver and a scope to trace the signal path of a transmitter are indespensible. Box the problem and go from there.

I misplace things on a regular basis about the house. My XYL constantly reminds me that it is a total waste of time searching where it could not possibly be. Annoyingly, she reguarly joins the search, and finds the item in a room or a drawer that I had previosly seacrhed.

These thoughts or skills are directly transferable to troubleshooting.

8477. Suggestion for "sales plan" for new MTR rig

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-03-04 19:47:11 UTC
From: Hank Greeb
Topic: 8426 Message: 8477

Someone, not so long ago, had a rig (or several rigs of the same kind), and instead of selling to the very first person(s) who sent in for it, the seller held the "sale" open for a day or two (or more - I didn't keep track).

When the "sale" was closed, this person selected the winner(s) at random. That way the "first person" reading the "sale" message had a equal chance of "winning" the sale as a person who might be working for a living at the time and didn't read the "for sale" message until arriving home several hours later.

I don't know how this would work in practice, or if KD1JV would even entertain such a "raffle" but if the demand is what it appears to be for the Mountain Top Radio, the number of people wanting the kit might be considerably higher than the number of kits made for the initial run. Note, generating a series of random numbers is quite easy using Microsoft Excel, Open Office, etc.

Just a SWAT (S)tupid W)ild A)...d T)hought) on a possible method of sale.

BTW - we should all applaud KD1JV often and loudly for his efforts at promoting QRP and field operating.

Hi Mike, Wear one pair, and have another lite mag lamp within reach. OR.. Harbor Frieght has had a headband magnifier that works and can be worn over glasses too. Now, about the DMM.. that works fine, just calibrate it with careful measurements in your shack. Then, you may, may want to expand... a whole lot of stuff can be made, espeially from free parts. (Free for the pickin up,... as in after the garage sale, offer to haul away the old tv.)

I've not tried this yet, but for taking a close look at a circuit board, someone spoke about taking a close-up photo with their digital camera, loading it into their computer and blowing it up. I suspect that this will only work with a pretty good digital camera.

> random.

Well, the thought of a raffle did cross my mind. Hard to say if we'll really need it or not. So far, only members of this group know about the rig, though there are over a 1000 members. Of course, no way of knowing how many keep up with the group on a frequent basies.

I was going to wait a bit, but this is what I've been thinking. Break it down into groups.

I'll put aside a few to take to Dayton for those who want to wait until then. That might be a dozen or so at the most.

The second group will be those who intend to use the rig for what it was designed for - SOTA or backpacking trips. This of course will have to be on the honor system and no telling how big a group this is.

The third group will be every one else, limit one per person. If there are any left over after that, a second one can be ordered.

Sound fair enough?

Steve KD1JV

Whatever you want is fair, Steve, since you are kitting them.

An additional thought (since you asked): one per customer at the initial offering, requests for additional kits wait listed for a first few days, then filled as available.

So how does one decide how big the groups are to be? What will make it fair? We're starting to sound like politicians. The truth is, there will be more demand than supply and the classic answer is to raise prices. Wait did I just say that? Ha ha. Glad it's Steve's decision and not mine.

I think a more fair approach would be to have two groups, those who already have an ATS and those that don't. There always seems to be a few guys who just missed the boat getting one. So maybe 3-5 days for the ATS virgins then open it up to the rest of us. It would be on the honor system. Those who try to scam the system by getting their buddy to buy for they will suffer eternal pangs of guilt with every QSO.

8486. MTR sales gimmick -- really needed?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-03-05 17:13:40 UTC
From: shadle
Topic: 8486 Message: 8486

Steve's the boss, but I'm not really convinced that he needs a sales gimmick (i.e., first crack goes to those who don't have a KD1JV rig; split the group into those who will do mountain-topping with the new rig; etc.).

Check out the message from this group, nearly 4 hours after the sales were opened for the latest batch of ATS-4 rigs (http://groups.yahoo.com/group/AT_Sprint/message/5387):

"Wow, that didn't take long! At least half of the 100 are spoken for already. Thanks for all the orders."

Steve has always been transparent with when the rigs will go on sale, so folks should not feel like they're at a disadvantage when it comes to buying these (unless you're going to be away from a computer for a few hours during the sales window). If 1/2 of the rigs are gone in 4 hours, then that is not that great of a demand. We're talking about hours here, not minutes. Plenty of time for folks to make their orders.

Just my $.02.

John:

Good question(s). You hit the head right on the nail.

But, I know from reading this reflector, that there are many who wish they had bought at AT-Sprint 3, 3a, 3b, 3b2, 4, etc., a few hours or daze after the last one sold.

Yup, Steve has the only vote which counts.

Speaking from experience, lists are a real thorn in the side of a seller. It is absolutely impossible to accommodate each contingency and/or buyer.

Perhaps timing the announcement correspond with the time of day when most hams are home might might add an element of "fairness". But that is as far as anyone ought to go in asking for special treatment, IMHO. I'd expect that those who want the rig will be close to their keyboards and amongst the first to place an order.

Let's not place Steve in an uncomfortable position with this. Just keep your eyes open and order when possible. If you miss the first run, there will be a second, and maybe even a third, life goes on.

Back to the bench, Winter's too valuable to waste.

Steve,
After an initial run, why not make circuit boards and perhaps pre-programmed CPUs available as a "semi-kit", leaving most of the parts to be scrounged (purchased, collected, sourced, etc.)?

Just another thought...

My experiance with that is that it is a waste of natural resources, as few would actually spend the time or money to collect the parts. Enough of these sit unbuilt as it is, even when all the parts are in one place.

Problem is, we have a world wide customer base. I kinda feel bad about making some stay up or get up in the wee hours of the morning to order the 4B kit when I opened orders at 11:11:11 on 11:11:11. It might have been 11 AM here in NH, but not anywhere else! That aspect hadn't really occured to me before hand.

Steve,

Whatever allocation mode you choose will be ok for me, because this is still a hobby for both of us. I also agree you have to keep small volumes and don't take pre-order or so. That said, you are right about 11am at your place definitely not being 11am at mine...

73,
Yan.

Hello All:

I've started using my "old" ATS3a again, and for whatever reason the sidetone volume is seriously killing my ears now; not something I noticed before (different earbuds maybe).

Anyway, based on messages I see here, it sounds like a higher value resistor at R11 will take care of the issue. Two questions:

1. what resistor has worked well for others

2. do I understand correctly that I can use a resistor with leads there?

Thanks for your help.

8496. FOX: Thursday Night 40M Fox Hunt

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-03-07 13:58:22 UTC
From: Dale Putnam
Topic: 8496 Message: 8496

Here's a typical FOX announcement, and this one is for this coming Thursday evening. We're getting close to the end of the winter hunt season,Al and John are great FOXii ops, so grab the pelt, while you can.Good Luck to all,It's a fine day for a FOXHUNT, folks,

--... ...--
Dale - WC7S in Wyhttp://www.qrpfoxhunt.org

Hello all: I will be one of your QRP Foxes Thursday night, 0200-0330Z

(Friday UTC) somewhere between 7030 and 7050 kHz. Al, K2ZN, in NY will

be the other Fox. We will be running 5W, of course. I will be using a

coax fed half wave 40M dipole up about 50 feet and running north and

south, so it will favor east and west, but is a pretty good all over

antenna. I will start out split listening up and will indicate that by

sending "UP" at the end of the FOX call. When the pileup diminishes, I

will be listening on my own frequency and will stop sending "UP." I

will be giving "real" RST reports. Transceiver will be an FT1000MP

running at 5W as measured on the WM-2 QRP Watt Meter. My logging

computer is out so I will be logging on paper and that means I may be a

bit slower and will have to be very careful in transcription to a log

report that will be posted on the QRP Fox Hunt Reflector. I will be

able to use a memory keyer. Callers should be running 5W or less. I

hope you can all work both foxes Thursday, but know that closer in

stations may have trouble due to the skip usually found on 40M.

However, at about the same time in the ARS Spartan Sprint on 40M this

Monday night, I was able to work stations in AL, FL, and NC. Best

chance is at the beginning of the period, which is 0200 to 0330Z.

However, don't give up, as skip often shortens up toward the end of the

period. Exchange is RST, SPC, Name, and power and you can work only

the two Foxes.

73, John, K4BAI.

If you want to lower the sidetone level, R12 can be adjusted. I have a tiny 10k pot in mine, because, that seems to be a need sometimes.. to adjust that up or down a bit, according to the earbuds I use, or the band conditions, and the surrounding noise of the operating position.

It looks like R11 is the right one, although there was mention of R12. I thought R12 was relevant to the ATS3B (not A, which is the version I would like to fix).

R12 in my 3 is on the same side of the board as is R11, and yes if you can adequately adjust R12 easily, then that would work too.

From: Dale Putnam
Topic: 8500 Message: 8500

Tonight, will mark the 4th hunt before the end of the regular season. Two of the FINE FOXii will be out and about, scampering through the 40 acre wood, hoping to hand out pelts to each of the hounds following. Are you planning to be one?KEZN, Al, in NY, and K4BAI, John, in GA, are the chosen pair. Please drop by, 7.040 +/- 10 khz, at 0100z to enjoy the last 40M hunt before daylight savings time starts this weekend, to share a fun time with fellow qrp hounds. Check it out on the webpage, http://www.qrpfoxhunt.orgbut basically you call the fox, the fox calls you, sends the exchange information, you send the fox your information, and so it goes.Yes, it is for 5 watt or less.. and you may even hear some one with an R10... that meaning 10mw.. measured output. Although tonight it may be a bit tuff, with the solar activity of late, it does promise to be an interesting hunt, with a full moon, and maybe even some northern lights making sighting of the FOXii even more exciting. Good luck to all, It is a Fine day for a FOXHUNT, you see. --... ..---

8501. Hi temperature solder

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-03-08 22:33:02 UTC
From: Stephen Wandling
Topic: 8501 Message: 8501

I was recently gifted with a 45 Amp Converter/charger, that was inoperative. When I was pulling it apart, a large capacitor fell off of the board. When I had the board out so I could see the soldering, I could see that heat from a couple of adjacent 10W resistors had caused the soldering to fail on the cap. And, one lead on each resistor was also moving. So, I soldered these points, re-checked the unit and it was working! I've had it charging a battery for about 24 hours and it seems to be in the 'middle' charging mode. Hopefully, it will drop to the 'float' level sometime soon.

My question is this. Where does one find solder that is resistant to failing under heavy heating? I recall when pulling parts of off various boards, some of it required a bigger iron and more time to melt the solder. I want to install and use this converter/charger and I don't want it to fail for the same reasons.

When I say the 10W resistors are hot, I mean that I can not keep my finger on them for more than a second or two. They could probably blister my skin. And, the PCB beneath them is brown from heat. I guess it's possible that the hot resistors are a sign of another problem? I have no experience with these units, so I don't know.

Any tips will be appreciated.

Stephen;

I've encountered the same type of converter/charger, and the whole board was built with very inferior parts for the purpose. There are probably several other parts that have been heat damaged, so a very close inspection of every cap, resistor, coil, et all, is in order with a high grade multimeter, "wear out the Ohms metering". With the one I had, I kept it going with "silver solder", and put larger wire in the whole circuit, even bypassed the PCB areas with large wire. Got a lot of hours out of it before the useful life was up, factory-made components simply deteriorated until they fell apart from heat abuse.

If you can find a schematic for the converter, follow it carefully, find out if anything went out of value or had some accident. I realized that 45 amps is a bit much for some items to handle, demands very heavy circuit parts and a lot of attention to cooling, thus anything that uses so much needs to have a lot of air exposure. Only some industrial quality devices are built with longevity in mind, so you have that to figure out.

There are a number of online outfits who sell the "silver solder", which often requires a propane bottle hand torch to put the correct heat on a part, "Just long enough to do the job, then cool it down immediately", I used to keep an ice cube handy!

Perhaps there are others who have had more recent experience, just wanted to put my two cent's worth in. Good luck, be careful of fingers and blisters!

Gil,

You've given me an idea. I used to take my titanium framed glasses to be repaired at an optometrist who had a very tiny torch for silver soldering. I'm in a more rural setting now, but on my next trip into the big smoke I will take the board over and see if he can work on it. I do brazing, but I'm thinking my smallest tip (#2) would smoke the board very quickly.

Steve;

Good luck with that idea, I'm thinking along the lines of a jeweler's torch for some of the hi-temp work myself, with the replacement of the low-lead, solders for high temp alloys for today's circuits. The idea of using an incredibly tiny torch "in a box, to put micro-parts on an ATS board" is one process that demands some thinking about keeping track of the part while avoiding being "cooked" in a close environment. That's no thanks to some politicians of the EPA who are horrified at lead solder, yet have no idea of what it takes for hobby circuits.

My left eye operation, to replace the cataract-damaged old natural lens with a plastic one, has been successful, now to get past the healing process, and rethink a LOT of work items. Closeup magnifying glasses are a natural for me, proper ventilation of the work area for soldering, and otherwise wearing eye protection "in case of flying micro-parts" is a necessity.

I, too, ended up with my last pair of glasses having titanium frames, they are far better than brass and stainless steel, even.

Ho, gad, but a brazing tip would make carbon of the circuit board on that converter very fast!

Good luck, 73's

Gil WA5YKK (heading for eye drops and some pills for the eye healing - horrible taste, got to swallow 'em fast!)

I built mine with 15 and 17 and dropped the 80 option. All the details are already in the manual as it documents the coil windings and cap values for all bands. It's just aquestion of shuffling everything one place to the left except 15 which stays put. I did list out all the changes when I built mine but, as I'm away from home for a few days, can't actually post them until early next week. If you still need details I will do so when I get home.
Good choice by the way and a cracking rig!

8509. ATS-3B Button Replacement

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-03-11 06:18:29 UTC
From: radio_kx0r
Topic: 8509 Message: 8509

A few weeks ago I mentioned here that the control buttons on my ATS-3B were intermittent and needed fixing. The UP button was so bad that I couldn't really tune the rig around any longer.

Several people offered suggestions, and it turned out that I'm not the only one to have the problem. Because the button switches are all cealed, there's no point in trying to use contact cleaner.

I decided to replace the button switches. The first thing that I learned is that these devices are called "tactile switches". A quick search of Mouser and Digikey showed that tactile switches are available in many styles and dimensions.

I pulled out my ATS-3B board and measured the dimensions of the original tactile switches with the reddish-brown buttons. I believe these are made by E-Switch, P/N TL1105EF100Q, and sold by Digikey as EG2496-ND. In quantity 10 they cost $.24 each.

I also found several other very similar tactile switches. After comparing specs, I ordered 10 each of 4 different part numbers. The specs don't tell how they feel. Today I tested and compared them; then I replaced all four of the original switches in my ATS-3B.

The parts I chose for the replacements are made by TE Connectivity Alcoswitch, part number FSM6JH. Digikey sells these as 450-1652-ND. These cost $.18 each in quantity 10! They have blue buttons. What I like about them is that they have a very positive tactile feel - a distinct click that you feel when they make contact.

The new E-switch parts I bought look exactly like the originals. They feel a bit better than the old ones. The original buttons tilt around and have a sloppy action. While it's a light action, for me the FSM6JH wins, even though it takes a bit more pressure.

Another good similar part is TE Connectivity Alcoswitch FSM10JH, Digikey 450-1647-ND. These cost $.18 each in quantity 10. These have a white button that's a tad higher than the FSM6JH. They feel almost the same, with a good tactile feel.

Replacing the switches is straightforward. Use desoldering braid to remove the solder, and gently work the old switches out, using a little heat on any pins that aren't completely free. Be careful of the SMT parts close by on the board. The new switches have kinked leads that will hold them in a new board prior to soldering. I found it helpful to straighten the leads - then they're a perfect fit in the board. Make sure they're fully inserted before soldering.

With the new FSM6JH switches, my ATS-3B feels better and is much more pleasant to use. Now I can actually tell whether the radio is tuning or not! There's none of this nonsense about pushing the buttons sideways - these blue buttons work like buttons should!

I recommend this mod, even if your original buttons still work. It's cheap, and the radio is nicer to use.

Only time will tell if these tactile switches will last longer than the original ones.

PS - if you order the switches from Digikey, you can get some more mosfet finals just in case - the BS170G made by ON SEMI is Digikey BS179GOS-ND - these cost $.2564 each in quantity 25. Remember that the pinouts are reversed from the 2N7000 originally used in the ATS-3 rigs. I posted info on replacement here earlier, and there are pictures in the Photos section under KX0R - the BS170's with the little heatsink have worked out really well.

Mike,

I looked at the expected life. The original E-switch tactile switches claim 100,000 minimum cycles. I have used my ATS-3B many hours, but somehow I don't think I've pushed the UP button more than 100,000 times.

The TE Connectivity Alcoswitch FSM6JH switches also are rated for 100,000 minimum cycles. Only time will tell.

When I did my search I saw some tactile switches with much larger expected minimum cycles - but they didn't have the right kinds of buttons, dimensions, etc.

Wonder if you found that perfect switch...?

I am very please with this info, but want you to know another possible way to operate the ATS radios in a more comfortable manner. I found a very attractive 3 way jog switch that can be use to move up and down the ATS4 operating frequency and activate the functions menu. It is the Navigational Switch from Sparkfun.com.

I decide to try it and this is how it looks and function after the installation. Take a look here:

http://www.youtube.com/watch?v=U4euYhWmKQM&feature=youtube_gdata_player

I still use the original buttons, but now I found another way.

> A few weeks ago I mentioned here that the control buttons on my ATS-3B were intermittent and needed fixing. The UP button was so bad that I couldn't really tune the rig around any longer.
>
> Several people offered suggestions, and it turned out that I'm not the only one to have the problem. Because the button switches are all cealed, there's no point in trying to use contact cleaner.
>
> I decided to replace the button switches. The first thing that I learned is that these devices are called "tactile switches". A quick search of Mouser and Digikey showed that tactile switches are available in many styles and dimensions.
>
> I pulled out my ATS-3B board and measured the dimensions of the original tactile switches with the reddish-brown buttons. I believe these are made by E-Switch, P/N TL1105EF100Q, and sold by Digikey as EG2496-ND. In quantity 10 they cost $.24 each.
>
> I also found several other very similar tactile switches. After comparing specs, I ordered 10 each of 4 different part numbers. The specs don't tell how they feel. Today I tested and compared them; then I replaced all four of the original switches in my ATS-3B.
>
> The parts I chose for the replacements are made by TE Connectivity Alcoswitch, part number FSM6JH. Digikey sells these as 450-1652-ND. These cost $.18 each in quantity 10! They have blue buttons. What I like about them is that they have a very positive tactile feel - a distinct click that you feel when they make contact.
>
> The new E-switch parts I bought look exactly like the originals. They feel a bit better than the old ones. The original buttons tilt around and have a sloppy action. While it's a light action, for me the FSM6JH wins, even though it takes a bit more pressure.
>

> Another good similar part is TE Connectivity Alcoswitch FSM10JH, Digikey 450-1647-ND. These cost $.18 each in quantity 10. These have a white button that's a tad higher than the FSM6JH. They feel almost the same, with a good tactile feel.
>
> Replacing the switches is straightforward. Use desoldering braid to remove the solder, and gently work the old switches out, using a little heat on any pins that aren't completely free. Be careful of the SMT parts close by on the board. The new switches have kinked leads that will hold them in a new board prior to soldering. I found it helpful to straighten the leads - then they're a perfect fit in the board. Make sure they're fully inserted before soldering.
>
> With the new FSM6JH switches, my ATS-3B feels better and is much more pleasant to use. Now I can actually tell whether the radio is tuning or not! There's none of this nonsense about pushing the buttons sideways - these blue buttons work like buttons should!
>
> I recommend this mod, even if your original buttons still work. It's cheap, and the radio is nicer to use.
>
> Only time will tell if these tactile switches will last longer than the original ones.
>
> PS - if you order the switches from Digikey, you can get some more mosfet finals just in case - the BS170G made by ON SEMI is Digikey BS179GOS-ND - these cost $.2564 each in quantity 25. Remember that the pinouts are reversed from the 2N7000 originally used in the ATS-3 rigs. I posted info on replacement here earlier, and there are pictures in the Photos section under KX0R - the BS170's with the little heatsink have worked out really well.

8513. MTR - who wants to be first?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-03-12 03:41:55 UTC
From: Steven
Topic: 8513 Message: 8513

I should have the production boards in by the end of this week. I still need to get a few more parts before every thing is on hand in sufficent quanity, but I can get maybe 5 kits ready shortly after the boards arrive.

It occured to me that it seems there are always a couple of typos or part number conflicts to resolve in the manual after its release. No matter how hard I try, I can't find them all. I know where all the parts go, so I have a hard time following my own directions.

So, this time I'm looking for 5 builders who want to be first. Of course, the deal is you have to be willing and able to build the kit as soon as you get it and report back any errors or suggest improvments to the manual. -Oh and you'll have to buy the kit but I'll throw in postage :)

So, anyone want to volunteer? email me direct, please don't relpy to the group. steve.kd1jv@... (no doubt there will be more then 5, but we'll pick names out of a hat in that case..)

Hello Steve,

I'm interested by an MTR 80/40m version. I asked a friend to build it for me. He's a very neat builder and completed recently a high level solder certification (IPC class 3). Rob NV5E is living in Arlington, Tx. So if you agree to sale us an exemplar for this run test I'll pay for it and you'll sent it to Rob : he would report directly to you.

I'm preparing to take the "Camino de Santiago" in a few weeks (that's a 1800 kms walk from my home) and I hope to have the chance to carry an MTR in my rugsack.

We had a similar discussion in our local CW community in Japan. One of our members was actually a designer of tactile switch in a major electrical component manufacture. He stated that it is designed for most of low end tactile switches for 100,0000 minimum cycles just as Mike mentioned, but it is only when you push it straight, not title its stem. It's life cycle is much shorter if it is not pressed straight. The best way is to use the D-pad (Cross button) that most game machine use for controller.

Subject: [AT_Sprint] Re: ATS-3B Button Replacement

Mike,

I looked at the expected life. The original E-switch tactile switches claim 100,000 minimum cycles. I have used my ATS-3B many hours, but somehow I don't think I've pushed the UP button more than 100,000 times.

The TE Connectivity Alcoswitch FSM6JH switches also are rated for 100,000 minimum cycles. Only time will tell.

When I did my search I saw some tactile switches with much larger expected minimum cycles - but they didn't have the right kinds of buttons, dimensions, etc.

Wonder if you found that perfect switch...?

One way to verify people who fit within the SOTA group (group #2) would be to just check the SOTA website and see if they've activated any peaks before. It would be harder to verify those who backpack but don't do SOTA.

Or should it be Alfa Builders?

Thanks for all the volunteers! Got pleanty now to choose from. Many were DX stations, but I think I'll have to limit it to US hams, if for no other reason then the unperdictable amount of time it can take to get through customs. Some times its a few days, some times a few months!

I'll get back to those I pick in a day or two so you can start cleaning off the bench.

Hello All:

After much too long a hiatus, I am finishing up the band modules on my ATS3B. The rig seems sensitive enough, and power output is right where it should be. However, the received signal does not sound crisp and clear. The signal sounds a bit muffled. This is true for both 40M and 20M. I have scrutinized the board, and I do not find anything that looks wrong. Has anyone else run into this issue or have an idea about the likely area of a problem?

Thanks.

Mike--NR7F

8522. Rotary Encoders are ready for shipping

From: Petr
Topic: 8522 Message: 8522

Hi,

this message arrived tonite from Miroslav,

Hello,
I would like to inform you that the kits of rotary encoders for ATS are ready. The price remains the same 25 USD for one kit. The shipping cost is 5 USD for one kit, 6 USD for two kits and 7 USD for three wordwide. You can send the payment to my Paypal account diy4funatgmaildotcom.

Please put the version of your ATS into the payment note, because I have two different firmware for ATS-3 and ATS-4. If you want to send the kit to different address than you have in your Paypal account, please let me know either in payment note nor in email.

Thank you.
Best regards
Miroslav

So probably last batch of these kits is available now for ATS radios.

Do you have the BFO trimmer adjusted? Check connections in the audio path
for missing or bad ones, try different head phones.

Thanks for the comments, Steve.

Yes, I did adjust the BFO trimmer, although I'll go back and double check my adjustment. I do not have a scope, so per the directions, I did that adjustment by ear. Maybe a scope would be a way to double check that adjustment. I could probably get access to one, as well as someone who is competent with it (I've never used one).

I know the ear buds matter, but I've compared my 3A and this 3B, so I know something is different with the 3B in terms of the audio.

Otherwise, I'll do another check of the audio path.

From: Dale Putnam
Topic: 8525 Message: 8525

Results through Hunt 34 are posted on the Web page: http://qrpfoxhunt.org They reflect the condtions on the bands, to say the least. There is drama and excitement as the finishing hunts come down to the wire, for one, the teams are getting a hard run on 80. Who's going to pull that one out of the hat? Then, how about the rights to Top Hound on 80 or 40? Or the TOP FOX on 80 or 40 ? Who is it going to be? Inquiring minds want to know. And if you don't want to miss the action, drop by tonight and see the action, first hand, on 40. With all the solar activity of late, it will be an exciting and invigorating time for all. And some of these Foxii.. are masters at the hunt.... I learn something new every time. Good luck to each, FOXii and Hounds, newcomers and experienced, y'all come, y'hear?

From: Steven
Topic: 8527 Message: 8527

Sorry I haven't gotten back to anyone about the beta builds yet. I kinda got side tracked this week.

First, I checked my parts and to my dismay, found I ordered the wrong switches -both the push button and the slide switches and if that wasn't bad enough, I forgot to order one part all together. So, those should be here tomorrow. I did get the boards and have one mostly built up.

Second, this is Maple sugering season up here in NH. A freind of mine has a Maple suger house and I help out there by keeping the wood flowing between the stack out side and the boiler inside. It's a full time job to keep up and earlier this week the operation started up. All this for a quart of freash syrup - but it's worth it! Mainly it's an excuse to get out of the house for a good part of the day.

So, as soon as I can get some more loose ends tied up and have a chance to bag some parts, I'll get back to those on my list.

I have been holding on to an unbuilt ats-3b.1 which I got at a hamfest a couple of years ago (i built one in 2009 that i still use regularly). The fact that the value of these limited run kits increases with time, I was going to put it on ebay. (i recently saw a built ats-3b.1 sell there for $295) ... but after reading all of the emails about the Mountain Topper rig kd1jv is getting ready to issue, I began to feel uncomfortable about being a "speculator" and taking advantage of scarcity. I know there are people out there who would really like to own one of these radios but they simply missed out at the time, or weren't aware at the time.

I am really interested in getting one of the Mountain Toppers when they come out so I'm willing to part with the unbuilt ats-3b.1 kit for basically cost ($200 to my paypal account). However, the prospective purchaser must certify that they do not already own one of the ATS rigs. I'm looking for a real "newbie."

(While I have no way of knowing whether the "certification" is true, I'm sure the "radio gods" will curse the cheater by rendering their build of the kit DOA (hi hi).)

In order to give everyone who wants this rig a fair shot at it, I will honor the first request received after 0001 utc on March 19, 2012 to "my call at arrl dot net." Good luck all and keep up the good work kd1jv!

8533. NAQCC Sprint Wednesday night!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-03-17 15:55:30 UTC
From: NAQCC
Topic: 2848 Message: 8533

NAQCC Sprint Wednesday night!

Our March sprint is this coming Wednesday evening local time (March 21, EST - 8:30-10:30PM, CST - 7:30-9:30PM, MST - 6:30-8:30PM, PST - 5:30-7:30PM), which translates as Thursday March 22, 0030-0230Z in all cases. Note the Z time change because of going to Daylight Savings time on March 11.

I will refer you to the proper URL:

http://naqcc.info/sprint201203.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX. A Certificate for top score in the GAIN antenna category. Finally there is one more award - a certificate to the highest score from a first-time participant.

Prizes: A prize of a set of bug/paddle handles or a K1/K2 knob insert donated by master woodworker Gregg WB8LZG is awarded for each sprint to the winner of a random drawing among all participants. Previous winners are not eligible.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 5,940+ members in: All 50 States - 9 VE Provinces - 90 Countries. Just sign up on the NAQCC website (http://naqcc.info/) and you will receive a handsome certificate, with your membership number which is good for life.

Come join us and have a real good time!

Yes, it is difficult, and costly. Especially when insurance is paid for and when the package is lost, the insurance claim is denied because it "was delivered, in country"...and it didn't get to the destination, nor returned. Not a good plan. Kinda leaves a bad taste.

I', finishing up the caps on my ATS4b and don't have the specified orange packaging for C6, C38, C39 and C41. I do have 4 caps in a white (uncolored) package.

This is probably them, right?!

I hope so. I don't know how I could have missed not seeing that they weren't color coded when snipping them off the rope, but I guess it could have happened. If everything else worked out correctly, then the process of elimination leads to that conclusion. I was up late packaging some of these...

Whoa hoss! Where is all of this coming from? Canada, my current home.
is not the third world and I have successfully and easily received items
from all over the States and elsewhere. Insurance isn't an issue for
the sender anyway, so why are we mentioning it? I smell a bit of
chauvinism here.

Nothing intended toward North America... I read that as US AND Canada. Was intended to alert folks to checking on how much actual coverage and the safety is afforded to the prize being shipped.
Have a great day,

Hi,

and how Steve and Elecraft and others can send the Kits and others
easy without problems and high insurance to Europe? I often buye
things in the US. Most of time it is no problem, but sometimes the
fees are more expensive as the bought stuff... Buying via Ebay was
much easier some time ago...

Just a thought....

I dont want to enter in a contreversy but, I buy and sell all over the world since 10 years. The cost is not an argument because the buyer choose if its costly or not! In case its need an insurance I prefere use Fedex or UPS. Fortunatly almost all ham's do the same! Imagine if all ham stuff are "hand delivery" !!

Tonight is the March 2012 edition of the Run For The Bacon. That friendly lil' ol' QRP Sprint sponsored by your friends at the Flying Pigs QRP Amateur Radio Club International. Join us for a spell to have some fun and to say "Hi" to friends, old and new.

The time is the same as always:

East coast - 9:00 to 11:00 PM local time
Midwest - 8:00 to 10:00 PM local time
Rockies - 7:00 to 9:00 PM local time
West coast - 6:00 to 8:00 PM local time

The rules are at:

http://fpqrp.org/pigrun/

Dale,

My apologies to you and the list. I had just returned from day 5 of searching the bush for my friend who totalled his truck on a big alder and hasn't been seen since. I shouldn't ever write emails when I am exhausted and frustrated.

No problem, Stephan, none at all. Apology accepted, and thanks for the explanation.It is always a concern when we learn of folks missing.My prayers are with him, and you, until better news is heard.And it isn't like we all haven't written in haste, or at the wrong time.Shucks, don't worry about it. Hope your friend shows up safe, and sound.

Well, better send it to the Third World then.
I ordered or have been sent many items (kits, parts, toys, books, wine, books...) and it never got stuck in the customs making the whole shipping longer than 3 weeks. It often arrive in less than 2 weeks, once it was 5 days!

73,
Yan.

My experience with Canadian Customs has been the same as his if using
FedEx or UPS. I've never had issue with USPS. Shipping to CA with UPS
or FedEx is not fun. Don't do it unless you have to.

I ship things to various countries without such problems. UPS or Fedex will handle all customs so long as the paperwork is properly filled out. As for Shipping fees and Insurance, that is the purchaser's responsibility anyway. Shipments to Canada usually are either next day or second day unless the paperwork is wrong. Anyone who sells only one general type of product can easily learn the customs code and include that in the paperwork. Do not use any countries postal service!

From: Steven
Topic: 8549 Message: 8549

Like I mensioned a few days ago, it's sugering season here in NH and I've been helping out over at a friend's suger shack a few miles up the road from me.

We now have Grade A "Dark Amber" available for $18 a quart or $32 a half gallon (shipped as two quarts). Postage is the killer - $10.95 for either a quart or half gallon (flat rate priority box). Once you've had REAL maple syrup, it's hard to go back to colored corn syrup!

I can take payment through my paypal account.

72, Steve KD1JV

Two things I've learned about US shipments into Canada is that if it's USPS and the value is greater than $100, then a broker has to be obtained and paid. This can add some time, though the fee is simply collected COD.

But FedEx and other courier services provide the border services, so no broker is needed.

But, if I want you to send me something and I want it insured, you will buy insurance from USPS won't you? And if they refuse to honour their insurance, that's a USPS issue, and it seems to me that has nothing to do with the Canadian border services or CanPost.

Just noting here so as not to be confusing to others:

1. The pictorial shows R11 (100) but this part is not one of those mentioned in the "to install" list below the photo.

2. The photo shows "V1" - the list below photo refers to it as "V2".

Topic: 8557 Message: 8557

I'm looking forward with anticipation to the last hunt of this, the 80m season, with N9AW, Jerry, and KI0II, Ron being the Pursued Foxii.. and a fine pair of FOXii they both are too. It is also noteable that this will be the last FOX outing for Jerry as a member of the Fox Committee, we will miss him in that capacity, he has been very tireless, and helpful, always striving to improve the FOXHUNTS. My best wishes to him as he continues with his professional approach in future challanges and endevors. And Best of Luck to Ron and Jerry, fine ops both, for a good hunt, with the start being with greyline overhead in parts of the country, it will prove to be a challange to grab a pelt, and interesting to watch the propagation princess as we recover from the past solar penominons... (fonenetically, right?) 80 is predicted to be fair in day and good at night.. and with that, prognostication... who can tell? See you in the hunt, and Good Luck to all and to all a Good Pelt!

8558. Question about regen receivers?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-03-20 13:43:03 UTC
From: Hank Greeb
Topic: 8553 Message: 8558

W7AQK mentioned he was interested in building a regen receiver from scratch. That brought up some activity in the usually dormant vacuum between my ears.

Back in 1949 or '50 I built a one tube regenerative receiver, using a 1T4 or something similar. I used 20,000 ohm "Trimm Featherweight" earphones from my daze at building crystal sets. They were the most sensitive phones I found in my father's junk box. I could receive all sorts of AM broadcast signals, all sorts of 160 and 75 metre AM signals (SSB was a rare curiousity in those daze), and CW signals (which, at the time, I couldn't decipher but were there in the 160 and 80 meter band)

This brought up a question: Most (all which I found) regen receivers using transistors use a high gain audio amp after the detector. Why do we need a LM-386 or similar audio amplifier after a transistorized regenerative detector? Are the current day 8 to 16 ohm headphones so "deaf" compared to those of ancient daze?

Any and all replies are welcome.

> "deaf" compared to those of ancient daze?

Some of the modern earphones, even the tiny ones, are very sensitive. They are likely equipped with rare earth permanent magnets. But these earphones are all of low impedance, therefore they will cause impedance mismatch when connected to high impedance circuit like crystal detector.

I was already thinking of making an impedance converter with audio output transformer for the low impedance phones. There are tiny audio transformers inside the old transistor radios, that could be repurposed.

That depends on how far away you are, at current gas prices, it costs me almost $3.00 to go to the post office and back! This weekend it open house at the suger house (state wide event) so if your in the area - email me direct for directions.

Topic: 8564 Message: 8564

Man, I can't belive it. I have 150 useless boards to throw away!

To make a long story short, some how while fixing the mistakes on the first pass prototype board, a couple of new mistakes crept in, which I didn't notice 'cuz they shouldn't have.

Two of the mistakes could have been fixed with new assembly instructions, but the third one I just found which is keeping the DDS chip from working needs a new board. The first two problems were just missing connections, the third has connections going to two pins swapped, which is a lot harder to fix.

So, I guess I'll have to buy some new boards and hope I get it right this time.

That's sad news, and most especially for you, Steve.

Would it have been a saving to have just a couple of boards made initially for your debugging, or would the set-up expense pretty much have eliminated the the 2 vs. 150-boards price difference?

Subject: [AT_Sprint] MTR: another delay

| Man, I can't belive it. I have 150 useless boards to throw away!
|
| To make a long story short, some how while fixing the mistakes on
the first pass prototype board, a couple of new mistakes crept in,
which I didn't notice 'cuz they shouldn't have.
|
| Two of the mistakes could have been fixed with new assembly
instructions, but the third one I just found which is keeping the DDS
chip from working needs a new board. The first two problems were just
missing connections, the third has connections going to two pins
swapped, which is a lot harder to fix.
|
| So, I guess I'll have to buy some new boards and hope I get it right
this time.
|

I've always been a sucker for regenerative receivers.
A really elegant solution, especially back in the day
when a vacuum tube was a day's salary.
Just keep in mind, those 80 year old tube designs can transmit
about as well as they receive.
Jerry Gaffke, KE7ER

Very sad, but one good thing, we are hoping to have the new MTR on hand soon. Very interest to see that all the response are asking to keep the boards and fix them. Even, I am tented ...

He, he, very interesting.

Hi Steve,

Just a thought and likely you had it as well. If your alpha/beta group were highly skilled they might be able to do some rewiring kind of as Terrty WA0ITP suggested. I've had to cut traces and use 30 ga magnet wire as jumpers (don't ask why...) to fix miswires on boards with SMT IC's. Might not be good for production boards but for a small group of motivated careful builders it might save you the time of waiting for yet another run of boards.

For some reason this rig has been giving me fits all along. Just the latest in little, annoying glitches. It happens sometimes. Once those are all fixed, it's going to be a sweet little rig.

The shop stopper problem can be fixed, but it's not easy. A ground and the reference clock input to the DDS chip are swapped. Idealy, this repair has to be done under a microscope. I'm sure some of you can do it, but not everyone. Not worth fussing with.

Steve;

At the risk of sounding dim about micro-problems, I' m curious about how much they cost - so I could obtain a few and make "tech decorations" out of them. Having a few in odd places as objects d'art could get some comments from the uninitiated and maybe cause a prospective new ham op to ask questions.

Just a thought, but I have "dead computer parts" mounted on the walls of my hobby rooms.....

Gil,

Good idea.

I've considered making a table top out of unused boards. Glue them down and cover with polyurathane. I might have enough for a dinning room table top, hi. I should at least make a coffee table.

Okay how about this, I send everyone a defective board in addition to the good one. The defective one could be used as a coaster when rubber feet are added or as a refridgerator magnet if a rubber magnet is glued to the back. To suggest a few off the top of my head.

I am sure me myself I can fix the two DDS leads with magnet wire and an exacto knife. It would be a great waste to throw the boards away.

Or you can just sell the boars as a "partial" kit if someone wants to build his own controller and VFO unit.

How about to offer a price break for a kit with the additional wiring necessary?

Good idea. Sell them as SMT practice boards or something like that. I'd get one just to play with the RX and add an external VFO.

Steve,

For those of us who are homebrewers, any chance we could buy a few of bad boards to cut and use in other circuits? I can imagine using the final amp in a couple of projects.

Best regards,
Michael KD4SGN

I've reworked worse here too. I agree with Steve, you can't expect the average guy that builds his kits to deal with it. However, if he offered the reject board and programmed MCU (no kind of guarantee obviously) for a cheap enough price (I could probably source the other parts), I would take one.

If it means putting a few of these kits out there for those able to do the needed mods and freeing up some for those in need during final production, then I am all for it and can handle a few cuts and jumpers.

Hi Pierre, The "E" is telling you that the "current fuse" has said the current is excessive. This is usually indicative of either too high a supply voltage or more likelya mismatched antenna. This is, of course, on a radio that has worked prior, and has just started doing this.Disconnect the power, for a couple minutes, repower it with just 9v, and connected to a 50ohm load. That should let it come up correctly, and prove the radio is ok.

You don't mention this, but did you just finish your ATS-3B? I had a pcb short that caused the same problem you have. Once I found and fixed that short it worked fine.

Steve, KD1JV had me test the finals transistors with an ohmmeter for a short, and there was one. Test yours and if you have a short, look for a incomplete etch in the area of the 47v zener. I used a very powerful flashlight on the opposite side to shine through the pcb to find that short. A razor blade or x-acto knife cuts the copper bridge just fine.

You can search my callsign and see the discussion on this topic in the group.

>
>something to think about...to keep a fire going in a small stove you will need to use small fuel, so you won't be able to leave it unattended for long. also these stoves aren't really intended to run for long periods, so ash buildup may start limiting fresh air needed for the fire.
>
>Steve (ae4yq)
>
>
>
>On 01/26/2012 09:54 PM, Steven wrote:
>
>>I ordered a TEG (thermal electric generator)yesterday which should prove interesting to play with. It claims to be able to produce up to 15 V at 1 A, or 15 watts and at 3" x 3" x 0.5" is reasonably small. However, what kind of delta T it takes to produce 15W is not specified, I'll have to figure that out on my own.
>>

>>A TEG is made up of bimetalic semiconductor junctions wired in series/parallel. When placed between two metal plates (typcially aluminum), then heated on one side and cooled on the other, electricty is produced. These can also be use in reverse, putting current into them will cause one side to get cold and the other hot. This is known as the Peltier effect and is used for CPU cooling. However, I found out the coolers have all thier juncitons wired in parallel, so only produce a small voltage when used as a generator.
>>
>>My plan is to use the TEG to charge Li-ion batteries during extended hiking trips. It's easier to arrange for fire at night then sun during the day! But there is something I want to try. For charging batteries, I will only need 5 V at a few hundred ma. Since that will have to be regulated, why not take the "wasted" power and put it back into the generator by mounting the regulator on the "hot" side of the TEG? In theory, over 10 watts can be pumped back into the TEG.
>>
>>I'm wondering if this can effectively bootstap the process. Cold running water is typically available out in the wilderness. Put the cold side heatsink into the running water and electricity should be produced though maybe not a lot at first. If this is disapated directly into the hot side of the TEG by a power transistor, it should start to warm up, making a larger temperature differental, making more juice and so on until some equalibrium is reached. Shades of perpertual motion :-)
>>
>>Another question is will there be enough surplus energy left over to do the charging? Yet other question is if the process has to be started by first heating up the hot side and if it would then remain self-substaining?
>>
>>But if that doesn't work, plan B is to get a little backpackable wood stove and use that as the heat source. I'm looking at one made of titanium plates which lock together to make a box. Since this stove has flat sides, attaching the TEG to it would be simple.
>>
>>The advantage of Plan A is that if it works it could be left unattended all night to charge something. Plan B would require keeping a close eye on the wood stove, which goes through fuel quickly. Not a lot of fuel, but it burns up small sticks pretty fast.
>>
>>In any event, this should prove to be interesting to try.
>>

8592. FOX: 40 Meter Fox Hunt - Thursday

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-03-29 15:23:17 UTC
From: Dale Putnam
Topic: 8592 Message: 8592

The Last regular scheduled FOXHUNT of this season, in the 40 acre wood, is being hosted by two very fine FOXii, WA4ILO and K9CW, fine operators/foxii.. (Thursday evening, 0100z, +/- 10 fm 7.040) and what a fine way to end the season, but to grab a pelt from each of them, in the 90 minute allowed to chase the fox. Check the rules: http://www.qrpfoxhunt.organd you can also find the results for the season so far. Now.. if the Game Warden sees fit, (is pleased with the turnout) the rumor is: There may be one more hunt.. in the combined forest, 80 and 40, with all the FOXii available to be chased. But the Warden has been very clear, if the turnout for this last hunt in the 40 acre wood isn't satisfactory..... My best wishes for a grand and fun hunt to each of the Fine Foxii and to each and every one of the hounds. It is a certainty, there will be pelts, to be had, and fun for all. Tis a fine day for a FOXHUNT!!

From: g8tmv
Topic: 8401 Message: 8593

"Steven Weber" <steve.kd1jv@...> wrote:

> It doesn't matter much if the cap goes to ground or across the resistor. Doing the mod to the 3's, its easier to put it across the resistor. It was easier to put it to ground when laid out on the board.

Steve, I recently tried this mod (cap across R3) on my ATS-3B and came across a problem with it.

My usual headphones work ok, but when I try my ear-buds I get a continuous tone while on Rx. I've tried several different types of headphones and have come to the conclusion that it's the lower impedance ones that cause the problem.

I've tried the alternative mod with the cap to ground but it doesn't make any difference.

Any ideas?

Colin G8TMV

The low impedance phones are causing the op amp to oscillate. You need to add a little series resistance or use higher impedance phones.

From: jr1kda_ag6gt
Topic: 8595 Message: 8595

Hello All,

Now I am making ATS-4B.
There are seven programming ports on board, but no connector is included the kit package.
I am wondering to put the additional connector on board.
Do I need the programming ports connector?
Also my PC has printer port.

Best Regards,
Sho/JR1KDA/AG6GT

8596. Re: [AT_Sprint] ATS-4B programming port

From: Steven Weber
Topic: 8595 Message: 8596

You do not need to put a connector in the programming port. If there is ever a need to use the port to update the firmware, SIP header pins can be inserted and make contact by friction, so they can be removed once the programming is done.

Steve KD1JV

Hello All,

Now I am making the ATS-4B.
There are seven programming port through holes on the board.
But there is no connector included in the kit.

I guess their are few many times to update the firmware, so kit does not
have a programming port connector.
I guess so.

So do I need the programming port connector on the board?

Best Regards,
Sho / JR1KDA / AG6GT

Well, wait month or so and you will :)
Bascially, It's the dual bander with an additional relay installed to make it cover 3 bands and repackaged in the NADC box, which is a lot more practical then the box the dual bander was in.

A new through-hole cw kit? I'd like to see that!

It's a mostly through hole rig.

8604. Deaf on 15M

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-02 23:27:58 UTC
From: nr7f_mike
Topic: 8604 Message: 8604

Hello all: My ATS3b is totally deaf on 15M. I just put the filter board together even though this is an old radio. I would assume it is a problem with the filter board, but I've checked all components, recounted turns on the torroids, even pulled the torroids to make sure connections were good and all wires are in the right holes.

Is it possible that something on the main board is wrong, but affects 15M but not other bands. I've only built and tested 40M and 20M so far.

I did notice that adjusting the spacing on LF1 LF2 do not affect power output on the 15M board, which does not seem right. It sounds like a torroid issue, but I really can't find a problem there.

Any help is welcome. Thanks.

Mike

Very likely it's the 15M filter board. Make sure the resistor is correct. Triple check all inductor's for continuity where it should be and where it should not be. Maybe clean off the board?

Hi Mike, Chances are it is the filter board. High likelyhood, the wire from the toroids doesn't make good connection, and of course, a clean board is a good board, If your radio plays well with the other filters, and everything looks and ohmeters well.. one last check, would be the connections of the band setting resistor. If you'd like, send it to me, and I'll check it over for you, send it back... you'd get to pay for the postage. I'm thinking it will play, sometimes... it takes a very strong light and a very good magnifier to see the issue.Good Luck,

Relocation forces sale of my built and working ATS4B.

It is setup for 80/40/30/20/15m.

Since completion it has worked 27 countries on my PAC-12 antena from Texas

Asking $255, shipped to USA only. Paypal OK. Comes with power plug and build CD

If interested email me off the list

Dave

Dale and Mike:

Thanks for the thoughts on this.

Boy, I've scrutinized the filter board, and just do not find anything. I've done the things you suggested, which is not to say I didn't missed a check that I should do.

The band is dead now, so I'll have to check again tomorrow.

It seems like the filter board but I went ahead and checked the voltage reading (and scrutinized my work on the main board). There are a couple voltage readings that are not close to what is in the voltage tables. Plus, I've never thought the receiver in my ATS3b is a good as the one in my ATS3a, which makes me suspicious of something on the main board. The 3b signals just don't seem quite as strong, and the tone is not as clean. I know the head phones can be an issue, but I don't know if head phones that work well on the 3a should also work well on the 3b.

I get these voltages:

U5: pin 1 is 5 volts, but it should be 1.3; pin 5 is about 1 volt, but should be 5v

U4: pin 3 is 2.6v but should be 0v

U6: pin 1 is 1v, should be 0; pin 3 is 3.5v, should be 0v; pin 24 and 24 are both 3.5v but should be 0v; pin 20 is 8v, should be 0/3.5v

U7: pin 13 is 3.5v, should be0

I don't know if any of these are signs of something wrong with the main board, but they sure don't match the voltage table. And it doesn't make sense that 20M and 40M work ok.

Sorry for through more into the mix. Trouble shooting is always a challenge for me, and doubly so with SMT when I feel like I need a microscope to check my work.

Mike
NR7F

The resistor is fine, and I checked the connection to the board.

There's a 15m filter board for the ats3? How did I miss out on that one? Man!

3b, yes. Obviously comparing the two rigs on other than 15M :)

8613. RE: [AT_Sprint] Re: Deaf on 15M

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-03 13:33:42 UTC
From: Dale Putnam
Topic: 8604 Message: 8613

Hi Mike, The voltages you measured are with a working filter... all the filters... or just the 15M one? The 3b has been noted as being somewhat sensitive to earphone impedances, to raise the level of the audio to the usable level. I'm interested in the voltages of U5, pin 5 specifically. Sometimes the band noise isn't high enough to tune the filter boards with due to the excellant filtering in the rx. Maybe using a very low pwr tx into a dummy load, would generate enough signal to tune to?

Subject: [AT_Sprint] Re: Deaf on 15M

Dale and Mike:

Thanks for the thoughts on this.

Boy, I've scrutinized the filter board, and just do not find anything. I've done the things you suggested, which is not to say I didn't missed a check that I should do.

The band is dead now, so I'll have to check again tomorrow.

It seems like the filter board but I went ahead and checked the voltage reading (and scrutinized my work on the main board). There are a couple voltage readings that are not close to what is in the voltage tables. Plus, I've never thought the receiver in my ATS3b is a good as the one in my ATS3a, which makes me suspicious of something on the main board. The 3b signals just don't seem quite as strong, and the tone is not as clean. I know the head phones can be an issue, but I don't know if head phones that work well on the 3a should also work well on the 3b.

I get these voltages:

U5: pin 1 is 5 volts, but it should be 1.3; pin 5 is about 1 volt, but should be 5v

U4: pin 3 is 2.6v but should be 0v

U6: pin 1 is 1v, should be 0; pin 3 is 3.5v, should be 0v; pin 24 and 24 are both 3.5v but should be 0v; pin 20 is 8v, should be 0/3.5v

U7: pin 13 is 3.5v, should be0

I don't know if any of these are signs of something wrong with the main board, but they sure don't match the voltage table. And it doesn't make sense that 20M and 40M work ok.

Sorry for through more into the mix. Trouble shooting is always a challenge for me, and doubly so with SMT when I feel like I need a microscope to check my work.

Mike

NR7F

The resistor is fine, and I checked the connection to the board.

--- In AT_Sprint@yahoogroups.com, Dale Putnam <daleputnam@...> wrote:

>

>

> Hi Mike, Chances are it is the filter board. High likelyhood, the wire from the toroids doesn't make good connection, and of course, a clean board is a good board, If your radio plays well with the other filters, and everything looks and ohmeters well.. one last check, would be the connections of the band setting resistor. If you'd like, send it to me, and I'll check it over for you, send it back... you'd get to pay for the postage. I'm thinking it will play, sometimes... it takes a very strong light and a very good magnifier to see the issue.Good Luck,

Subject: [AT_Sprint] FS: ATS4B

Relocation forces sale of my built and working ATS4B.

It is setup for 80/40/30/20/15m.

Since completion it has worked 27 countries on my PAC-12 antena from Texas

Asking $255, shipped to USA only. Paypal OK. Comes with power plug and build CD

If interested email me off the list

Dave

8616. help with menu

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-03 06:14:18 UTC
From: Tim Goodrich
Topic: 8616 Message: 8616

Hi all,

I recently took delivery of an ATS3B and am having some difficulty with the menus. Somehow, the rig is stuck in a mode that has the freq up/down keys in a transmitting mode. I know this is an option and I have tried to disable it by holding mode, cycling through S,M,D,P, and A, then pressing SPLIT to choose between "A"lternative and ""N"ormal. I've set it both ways and the freq up/down buttons continue to transmit.**** I think I just fixed it. First, I changed it back to alternative mode and then hit split to exit (or enter) transmit mode. This made the freq up/down buttons revert to their purpose of changing the freq, but now, when I hold down Menu and it reads out the S,M, etc, the rig is actually transmitting. Any help here?

And does anyone have a cheatsheet and/or graphic that more easily explains all these functions?

Very frustrated,

Tim

Either your not counting the pins correctly or you have a bunch of bad solder connections. With some of the votages you list, it should not be working at all.

Seeing that pretty much every one of these which have been sent back to me to look at I've fixed by repairing solder connections, that's what you have to look for.

I've narrowed it to U5 being the problem. The other voltage reading issues were me pressing down on a menu button as I touched the board for the readings. The reading on U5 are off regardless of which board in attached.

So pin 1 on U5 is much too high, and pin 5 is much too low. I think this would explain why I've never felt this radio receives as well as my 3a.

I do not solder SMT very pretty, so somewhere in my poor soldering is the problem, but darned if I can find it. I use a very power full magnifier, and I've touched up suspicious connections obviously still not getting it right. I checked and touched up components that connect to U5.

I really should stay away from SMT kits, but there just is nothing close to the performance and compact nature.

Mike,

Take another look at page 27 in the documentation.

Pin 1 on U5 is connected directly to the 5 VDC supply and can only be 5
VDC. Pin 5 is supposed to be 0.96 VDC.

I am not sure why you feel these voltages are wrong.

If I had to guess, I would suspect that you might not have gotten the
toroid wire scraped bare enough on LF3 and/or LF4, before soldering it in.

Going way back to your first message, you didn't say anything about voltages, etc. You mention voltages later - but did you compare voltages at various points when you have your working 20 metre board installed vs voltages with your non working 15 metre board? It seems very specious that you could be getting normal output on 15 Metres, yet the recevier won't receive on the band.

And, it also seems strange that the rig works fine, makes contacts, etc., on 20 and 40, but not work on 15 metres

Try making a spreadsheet of voltages on various bands at several points - maybe that will help the "gurus" understand the situation.

Correct, the voltages were a new discovery. I went back and checked the main board after my message. Per one of my messages, I think it's U5 that has the issue (although, the filter board for 15M may be problematic too). It's only because I've had a nagging sense of something not quite right with the receiver (signals never seemed real clean) that I went back to the main board after 15M failed to work.

Topic: 8604 Message: 8624

Thanks everyone for helping with my remedial electronics abilities :) The problem is resolved, and it partly relates to operator error. Figures.

First the voltage issues. The manual that came with the radio is different than the version ATS3b1 in that the pin locations in the schematic, and the voltages in the voltage tables are different. In using the 3b1 manual (rather than the 3b manual), which I assume is really the right one, all voltages are fine. This is what happens when you mostly leave the hobby for 3 years with the radio only 80 percent finished, then come back to finish it; you get out of the loop. Thank you Stephen VE7NSD, for pointing out that from your perspective, the voltages were fine. That made me suspect there was an updated manual out there.

As far as 15M, well, it works now. I don't know if it's because I redid the torroids or because Dale WC7S comments about adjusting the trimmer caps carefully, with a signal, not just band noise made me go back and redo that part....or both. But anyway, adjusting the caps to a weak signal made a big difference. I also find that the caps are a little "peaky"...they like a pretty specific setting.

And thanks Steve for responding about the voltage readings. Those comments also made me suspect something with my voltage readings was off, because in fact the radio DID work (on other bands) even with my crazy voltage readings.

I'm the world's worst trouble shooter, but I always learn from this stuff, and you guys are great for reading/commenting.

Thanks again.

I would assume it is a problem with the filter board, but I've checked all components, recounted turns on the torroids, even pulled the torroids to make sure connections were good and all wires are in the right holes.

Wonderful Mike, Being inexperienced at troubleshooting isn't a failure... only means you have a bit more time to learn it... no problem, and with thehelp that is available on the reflectors... you got it made... build away. Oh.. and don't forget to put the little guy on the air too... you can sure have fun there too.See you on the air one day.. we can do a 3-2-3-Q. Happy to hear it is working better now. You sure didn't waste this day.

Subject: [AT_Sprint] Re: Deaf on 15M--DEAF NO MORE!

Thanks everyone for helping with my remedial electronics abilities :) The problem is resolved, and it partly relates to operator error. Figures.

First the voltage issues. The manual that came with the radio is different than the version ATS3b1 in that the pin locations in the schematic, and the voltages in the voltage tables are different. In using the 3b1 manual (rather than the 3b manual), which I assume is really the right one, all voltages are fine. This is what happens when you mostly leave the hobby for 3 years with the radio only 80 percent finished, then come back to finish it; you get out of the loop. Thank you Stephen VE7NSD, for pointing out that from your perspective, the voltages were fine. That made me suspect there was an updated manual out there.

As far as 15M, well, it works now. I don't know if it's because I redid the torroids or because Dale WC7S comments about adjusting the trimmer caps carefully, with a signal, not just band noise made me go back and redo that part....or both. But anyway, adjusting the caps to a weak signal made a big difference. I also find that the caps are a little "peaky"...they like a pretty specific setting.

And thanks Steve for responding about the voltage readings. Those comments also made me suspect something with my voltage readings was off, because in fact the radio DID work (on other bands) even with my crazy voltage readings.

I'm the world's worst trouble shooter, but I always learn from this stuff, and you guys are great for reading/commenting.

Thanks again.

Mike

Yes, Dale, getting a dead radio to work is very rewarding. Though I wouldn't complain if they always worked after I built them.

I do put these to use; mostly in the backcountry. I remember the first time I saw one at a local QRP group meeting I was floored that so much radio was in so little space. I could not believe the band coverage, power output, and size of the radio. I "needed" one (and now two) for the backpack.

The following was posted on another reflector, I didn't want anyone to miss out on the fun!!
So thank you for letting me cross post this.

Have a great day,
Dale - WC7S
http://www.qrpfoxhunt.org

Do you miss the Fox Hunts yet?

For a reminder of what it was like, tune in next Thursday evening for the

FOXTRAVAGANZA!, traditional celeabration of the recently concluded Fox Hunt

season.

The FOXTRAVAGANZA! will take place on Thursday April 12th, just like a normal

Fox Hunt, sort of. It will start and end at the usual local times (0100Z -

0230Z), and the Foxes will operate somewhere within 10KHz of the QRP frequency.

But get this-- ALL of the Foxes, the Alternates, and Committee members can

call CQ FOX, on either 40M or 80M or both. An hour and a half of furious fun,

with no rules as such....

The Foxes won't expect to work as many Hounds as in a normal hunt, but the

Hounds should expect to work a LOT more Foxes!

Good Luck! And may the Fox be with you.

73 DE ET, N1FN

8630. ATS-3B Psk-31

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-06 20:54:24 UTC
From: kb2sdrjay
Topic: 8630 Message: 8630

Hello,

I have been trying to play with the ATS-3b and PSK-31. I have created the simple interface and I am able to tx with my Pocket PC (PPC-6700). I initially tried to setup the radio using another radio (ic-703) and computer and noticed that on the receive the radio was much lower(ic-703). I was unable to simply adjust the offset to get the two radios to talk. I eventually broke down and redid the reference oscillator and lo frequency trim adjustment. Still the offset was way too low. I had to adjust the CT1 and I was able to get the two radios talking. But the passband shifted to 1150. Is this normal or am I way off. I followed the directions in the ATS3b.1_Errata. Also the offset is now set at 1183. Any help would be appreciated.

also, I am not the original owner of the radio.

Topic: 8630 Message: 8634

You need to set the offset in Pocketdigi to match the rig, not the other way around.

The BFO (CT1) should be adjusted for optimum audio for the receiver. This will result in a side tone of about 600 Hz.

Now start Pocketdigi, and click on "tools" > setup > TRX control. When you get the TRX control window to open, click the button "ATS3/manchester" and under that is a place to enter an offset frequency. Figuring out exactly what frequency you need to enter there is the tricky part and can only really be done with another PSK set up near by. See how far off you are and make the correction to the pocketdigi setting and repeat until you get the Rx and Tx frequencies to match up.

This setting may have to be periodically checked, due to drift in the BFO trimmer.

"Figuring out exactly
what frequency you need to enter there is the tricky part and can only really be done with another PSK set up near by."

Steve,

Thanks for the reply. I initially tried that and was unsuccessful. I set everything up per the manual.

1. Set the marker on the Pocketdigi waterfall to be exactly 600 Hz. (tap the screen just above the frequency
ruler, use the waterfall zoom in the tools menu to get better resolution)
2. In the Channels sub menu, verify Pocketdigi is in BPSK31 mode and AFC is turned off
3. Set the ATS-3B to transmit by clicking on the lightning bolt to the right of CAT. Note that when
transmitting, the side tone reproduces the modulation tones and can be heard in the headphones.
4. Find the ATS-3B signal with the other receiver and select the signal on the waterfall of the PSK program
connected to that receiver. Its AFC should also be turned off.
5. Return to receive mode on the Pocketdigi by clicking the lightning bolt again.

**** Picked the signal up on the ic-817 at 21.059.42 while ATS-3B was transmitting at 21.060.****

6. Transmit a signal with the other rig.
7. Tune the transmit frequency of the rig transmitting to the ATS-3B so that the signal is lined up at 600 Hz
on the Pocketdigi waterfall.

**** Picked up the signal on the ATS-3B at 21.060.0 ****

8. Switch back to receive on the other rig and transmit again with the ATS-3B. If the ATS-3B signal is now
lower than what it was initially, you will have to increase the offset in the Pocketdigi offset setting. If it is
higher, you will have to decrease the offset setting. The frequency scale on the waterfall will not have
enough resolution to tell exactly how much you will have to change the offset value by, but you can get a
rough idea.

**** The Signal was higher, I clicked on it and it was roughly 649, so I subtracted 49 from the 577 to get 528 and it was spot on this round.****

Am I going in the right direction????

I appreciate your help!

Jason

Jason,

The sequence described in the manual is what I proposed to Steve and it is an overkill. There is a much simpler solution, much more robust.

1) Get yourself an exact audio frequency meter. A sound card spectrogram application like the DL4YHF's Spectrum Lab will fit the bill.

2) Switch the ATS-3b into BFO calibration mode and turn the BFO trimmer to adjust the audio frequency to exactly 625Hz if using the external PSK31 decoder board. The exact frequency is not important if using PocketDigi, but it shall close to 600Hz. Measure the BFO audio frequency with the precision of 1Hz.

3) After the BFO is set, launch PocketDigi and enter the same audio offset frequency you measured in step 2.

73, Vojtech OK1IAK, AB2ZA

Spot on might have been the wrong choice of words. I was still RXing in the wrong freq with the 817. As long as I am on the right path I will keep playing.

Thank you

8639. NAQCC Sprint Tuesday night!

NAQCC Sprint Tuesday night!

Our April sprint is this coming Tuesday evening local time (April 10, EST - 8:30-10:30PM, CST - 7:30-9:30PM, MST - 6:30-8:30PM, PST - 5:30-7:30PM), which translates as Wednesday April 11, 0030-0230Z in all cases. Note the Z time change because of going to Daylight Savings time on March 11, 2012.

I will refer you to the proper URL:

http://naqcc.info/sprint201203.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX. A Certificate for top score in the GAIN antenna category. Finally there is one more award - a certificate to the highest score from a first-time participant.

Prizes: A prize of a set of bug/paddle handles or a K1/K2 knob insert donated by master woodworker Gregg WB8LZG is awarded for each sprint to the winner of a random drawing among all participants. Previous winners are not eligible.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 5,970+ members in: All 50 States - 9 VE Provinces - 90 Countries. Just sign up on the NAQCC website (http://naqcc.info/) and you will receive a handsome certificate, with your membership number which is good for life.

This month the NAQCC European Chapter will also hold their monthly sprint on April 11th from 1800 to 2000 UTC. Rules on their websie at: naqcc-eu.org/

Come join us and have a real good time!

8641. MTR - almost ready!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-07 21:57:14 UTC
From: Steven
Topic: 8641 Message: 8641

Gang,

I just uploaded the MTR manual to the files section of the group. I've decided not to send a CD with each kit, so you will have to down load the manual. Not sending a CD will save me a bunch of time (it takes a few minutes to burn a CD and multiply by 150 ends up most of a day!)I can also now use some padded envelope mailers I have which the CD is too big to fit into.

I *think* I've found all the typos and omissions in the manual, but there well could be one or two lingering in there, but shouldn't be anything too major or confusing.

I have 89 kits pretty much finished and will be able to start selling and sending them out soon. Since this took longer than expected to get done, we're going to skip over the beta build part and just go for it.

I would like to request when ordering does start (Monday?) that those who indicated they would build it right away order first, along with those who are going to need one soon for SOTA trips, as we're starting to get into spring time.

Those of you who are just going to add this to the stack of unbuilt kits you already have can wait a little bit and see what's left - okay?

72 Steve KD1JV

I just fired up one of the new boards (figured I'd better try one) and wouldn't ya know it? I somehow dropped another track. The gremlins must come in after I go to bed and mess with the files, because that track was there on the first pass and should have still been there this time!

Well, the good news is this one is easy to fix, just needs a short piece of lead clipping to jumper between the ends of two resistors.

But that means I have to fix the instructions, so if you haven't down loaded the manual yet, wait a little bit. I'll try to include the fix later tonight.

72, Steve KD1JV

Steve;

Thanks for the note, and since I'm one of the "buy it now and wait for months to look in the package", I'll let someone else enjoy melting solder. Eventually, with better health and fewer problems that clog up my work, I'll find out if I need that rig - then find out if anyone has built one and wants to sell their de-bugged rig.

To the group - I had a "routine left eye lens" replacement done last month, & I had to keep low on heavy activity, still have Doctor's visits to make, but my vision has improved vastly. Two months ago, I was "near sighted, no farther lens correction possible, lots of cataract damage", now I'm "far sighted, can see distance easily, have to have bifocal near vision lenses made". Everything about my being able to see SMT parts has changed, thus my "melt solder" setup has changed, too. For anyone who might be facing the same surgery, there's no problem at all, no detail of your particular set of physical circumstances is overlooked.
Thanks for the bandwidth, 73's for now,

Gil WA5YKK

David,

Don't tell my wife, or my boss, but I've scheduled two days off of work just to get my MTR built, if I'm lucky enough to snag one.

The last weekend of the month I'm going camping with my sons and their Boy Scout Troop in North Georgia and have allocated space in my backpack to take the radio for a test drive.

I can't wait!

Vojtech,

"adjust the audio frequency to exactly 625Hz if using the external PSK31 decoder board."

Do you mean the simple interface??? That is what I am using. I am at work and have the tools here to calibrate the radio. I have set it for 10Mhz and set the BFO trimmer to as close to 625Hz as possible (624.7). I will try again tonight to see if I can get my 703 and ATS-3B talking. The procedure wasn't working for me this weekend, I was only able to get the two radios to talk by shifting the bfo to 1200Hz. It almost appears the radio is txing too low.

"After the BFO is set, launch PocketDigi and enter the same audio offset frequency you measured in step 2."

So I will enter 624.7 into pocketdigi and that should get me takling with the other radio set to the same frequency at 600Hz on the wterfall?

I will give it a shot after work, hopefully all will go well.

Jason

You need to move the arrow on the PocketDigi waterfall to 600Hz of course. The PocketDigi software listens and transmits where the arrow points to. I think it may point to 1200Hz by default. The arrow lets you tune the PSK31 signals inside the ATS-3b crystal filter passband, so you may "point and click" tune in around 500Hz subband without having to touch the ATS-3b tuning buttons.

Yes, but at this point it doesn't matter exactly what frequency (RF or AF) the other radio is set to. You're just trying to adjust the ATS3b so it transmits on the same frequency it receives on, so you and your QSO partner don't go walking up the band. As long as the ATS3b signal appears on the other radio's waterfall at the same spot that radio was sending, you've successfully completed this step. If that's true but the dial settings don't agree, that's a matter for the RF calibration. Good luck!

Ok,

I found something interesting it appears the ATS-3B is not displaying the right frequency. I keyed the radio up and tuned my ic-703 until I was able to receive the psk signal on the spectrum meter. The rig says it is txing on 21.059.45 at 600Hz but the ATS-3B display says 21.060.0. But with the 703 tuned to 21.059.45 I am able to communicate. what am I missing here? What calibration do I need to do to get it on freq?

ok
I ran through all the modules and got the displayed and actual frequencies:
Display Actual
80M 3.560.0 3.559.42
40M 7.030.0 7.029.43
30M 10.110.0 10.109.44
20M 14.060.0 14.059.45
17M 18.070.0 18.069.46
15M 21.060.0 21.059.47

Hey Gang,

Time to get the show on the road!

Those of you who want to build a MTR right away, or want one for SOTA, or just want one cuz it's so darn cute, go to the order page here:

http://www.qsl.net/kd1jv/MTR/MTRorder.htm

This rig was a bit of a struggle, but in the end, it all worked out really nice.

72, Steve KD1JV

So cute....

hoping W4CCV and K4BX will think so too

and join in the fun that one creative dude,

KD1JV, keeps coming to make this hobby so much more....

these guys will help me with QSL'ing for my ops

from YI9EO 10/11-6/12.

Over 4000 Q's, over 100 DXCC entities with

K-3 and wire in mulberry tree from Sulaymaniyah.

The tuner is an amp'ed up ALT (also a KD1JV

creation).

Thanks again es 73, Steve and gang....

Jerry N4EO/YI9EO

I don't want to put words in his mouth, but I'm guessing he will include the capacitors and resistors for whichever bands you want (40, 30, 20) and you choose at the time of the build--not at time of ordering. It's only a few different parts, so it's probably easier for him to put together the "full" kit than build kits on an a la carte basis.

The manual doesn't show 80m as an option in the build, but it does show it on the front page of the manual as a possibility. It looks like you can choose 2 of the 3 possible bands. I'm going with 40 and 20.

My guess.

From: Steven Weber
Topic: 8682 Message: 8682

Bands -

Not to worry. You will get the parts for 40, 30 and 20. Pick any two of the three.

However, if you want 80, I will have to know and make up a 80 filter parts kit for you.

Steve

8689. Minor Confusion in MTR Doc's

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-12 04:58:42 UTC
From: Mike
Topic: 8689 Message: 8689

While getting familiar with the new MTR documentation prior to assembly, I believe I found a minor issue in the parts list. C18 and C11 appear to be swapped in the parts list on page 5.

The table on page 8 shows C18 as 22 pF (orange), and C11 as 100 pF (violet). The parts list on page 5 shows C18 as 100 pF (violet) and C11 as 22 pF (orange).

Since the schematic agrees with the values in the page 8 table, I'm guessing the page 5 parts list is incorrect.

Steve, can you verify this? Could be confusing to a new builder.
73,
Mike WA6MER

8690. FOX - EXTRAVAGANZA TONIGHT

Take a look in the group's File section: <http://groups.yahoo.com/group/AT_Sprint/files>
There's a copy of the entire ATS3a manual, and a couple of versions of an ATS3a label that has the directions. I can't figure out Yahoo's alphabetization rules, so keep scrolling through until you find what you need.

Does not effect the build instructions, but off sheet references on schematic page 1 are perhaps a bit out of date:
"To U8 Pin9" should read "BSRES"
"MUTE_PIN20_U8" should read "MUTE"
"SIDETONE_PIN3_U10" should read "SIDETONE"
Also "TO ANT" might show a connector instead of an off sheet reference symbol.

You did pretty good if it works as well as most any of your previous rigs!

MTR not quite up, but close. Got as far as the BFO adjustment section, no obvious peak.
It'll wait till I have access to a scope on Monday.
On p6 of the manual: add Q5 to the list
On p12: PA gates are on Q7-9, and keying is done at Q5
On p12: I had to press RIT+UP, got "YR" in the phones, "r" displayed

I'll be interested in that source, too. My syringe, I thought, might still be good, but it had dried out.
I tried a little experiment, adding a drop or two of isopropyl alcohol and stirring it from the plunger side of the syringe. I felt pretty good about the project until I test-heated a component. The alcohol dried and left a powdery, unsoldery substance behind, and with a tiny 'pop' the entire chip literally flipped off the board like a Mexican Jumping Bean. I imagined that happening to a fully populated board... and decided it was time to shelve the MTR project until fresh Kester Easy Profile 256 is obtained.

Now up. Had a solder short across the ends of a couple 0805 caps. Can hear CW on 40, and heats up a 50 ohm resistor quite nicely.
Nice rig!

A few minor notes:
I think the silk for "BNDA" and "BNDB" is reversed, 40 meters was on the ones labeled "BNDA". (But the build instructions are fine.)

On p13 step 2, there's no stop on CT1, so no point giving it a 1/4 turn

On p13 in the middle, the "trouble shooting guide" is on page 14.

On p14 at bottom, Steve recommends using the "NXP print to identify pin 1 of the SA612A's. Good advice, as these don't have the dimple that the other IC's sport, and the bevel mentioned in the assembly instructions is almost impossible to discern. But note that the "612" on U1 as printed in the drawing of p6 is the opposite orientation of what the actual SA612A has, I'm sure somebody out there is going to put that one in backwards.

Jerry

On all those SOIC's, the part number is printed In all cases, the part number should be printed

Does anyone else notice that recent messages 8696 through 8725 are missing here?

Is this a quirk in my system, or do you all see them missing?
The search button where you put in the message number does not retrieve them either.

There were some key messages from Steve Weber in this group.

Very odd. They were there yesterday!

I tried logging in, logging out, etc.

Did Yahoo's server suffer a failure?

I've noticed the missing messages here too.
Tried calling them up as individual messages to no avail.
But they showed up in the email digest I subscribed to.

Also, if I went to http://groups.yahoo.com/group/AT_Sprint/
and clicked "Messages" from the menu on the left side, I
was getting only the stuff that was at least a couple days old,
but clicking "New Messages" at the top usually got the recent
messages too. At the moment, both seem to give recent messages.

I have 37 messages between these two posts, so it seems to be an issue on Yahoo server's end. They were sent out, but not stored?

My ATS messages are stored in Thunderbird, and I'm not at all sure how I might send them to you, except forwarding one at a time. Forwarding 37 messages would be a chore, but maybe easier than getting Yahoo to fix the situation? There are only 6 messages from Steven Weber in that group, and sending them to the list might cause confusion?

Maybe, as a moderator, Mike, W1MT, could exert some pressure on Yahoo.

From: Gil WA5YKK
Topic: 8732 Message: 8735

Carey, Steve, et all;

It's not just the Yahoo system which is backfiring, my area of the Internet is wobbly, and I use only the Thunderbird email for my messages. The one that Microsoft hands you is full of bugs, thus I've voided it for years. Thunderbird automatically puts a copy of every message you send into a file on the hard disk, an item that I discovered one day that saved days of work and valuable items! Forwarding from the 'saved in the file" process is the most logical way to go, since the inner workings of Yahoo are quite mysterious and unfathomable. Plainly, it's a computer machine, and any human return for help may not be possible.

Just some friendly advice, I've done a lot of suffering with files before I got the massive, independent, backup drives to plug into this machine.

From: n1rx
Topic: 8736 Message: 8736

Hello all.

I have created a new folder called "Messages 8686-8725" in the Files section. In that folder are three text files with the contents of the Digest messages sent covering the period in question. Anyone who wants local copies of those messages are invited to download the three digests. They are quite small.

-Back to the soldering iron!

This refers to the trimmer caps on the top of the board.
The issue only comes up when you try adjusting for maximum
received signal. The easiest fix at this point is probably
to edit the manual, reversing all references to BNDA and BNDB.

> On p13 step 2, there's no stop on CT1,
> so no point giving it a 1/4 turn
Perhaps there is a point to this after all.
I don't know how those trimmers arrive, probably set to min or max.
A quarter turn either direction would then set them mid range.

Jerry

Great minds think alike... It looked to me as though digests 1639 - 1641 contained all the missing messages. 1641 ended with your "no smoke" posting, which was message # 8726. So, we should be all set with those 3.

My MTR kit arrived Friday afternoon, but I have had the "on-call week from hell", and have only been able to start it this afternoon. So far 65+ hours to my employer this week, and have to get through tomorrow at 7am. That dang pager tends to go off at the most inconvenient time (like just when I am getting to sleep...)

Ha, not likely. I don't think we're a blip on Yahoo's radar screen. I wouldn't even know how to try to contact anyone. I suspect that the problem is on their end and they are working on it. Probably a server gone down. Wouldn't be surprised to see them reappear in a day or two. Thankfully we have some on the ball members and the missing messages have been made available.

I am not rady to put power to mine yet- perhaps this evening. I hope you are keeping track of these firmware notes. Did you hear anything back from Steve on this one:

"On p12: I had to press RIT+UP, got "YR" in the phones, "r" displayed".

Hearing "YR" instead of "CF" is too bizarre. Also, you said you saw a lower case r on the display instead of c. I thought perhaps you had a bad solder connection and the lowest horizontal segment wasn't working... Is the display working properly other wise? Were you able to complete the freq calibration?

I plan to work on the rig today, in between e-filing my tithe to the govmnt.

8747. Manual corrections

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-16 08:37:11 UTC
From: Scott Cowling
Topic: 8726 Message: 8747

Hi Steve and the group,

Here are a few manual corrections that I found while building the MTR. I am not done yet, but I have all of the parts on the board except for the five toroids.

Here is what I found:

Parts list, page 5:

1) left column, line 16. 113K resistor: "Color code or value #" column is "1132", should be "1133"

2) left column, line 17, 267K resistor: "Color code or value #" column is "2672", should be "2673"

3) left column, last line, 8.6uH inductor: "Value" column is 8.6uH, should be 8.2uH;
left column, last line, 8.6uH inductor: "Location(s)" column is "GRY/BLUE/GLD/GLD", should be "GRY/RED/GLD/GLD"

4) Right column, line 3, TC1014-3.3VCT713: "Color code or value #" column should include the color "BROWN"; part is marked that way

5) RCA antenna jack is in the kit, but not listed in the parts list

Semiconductor placement, page 6:

6) Q5 is missing from the table in lower right corner:
Add line at end of table with "Location" of "Q5" and "PART #" of "2955"

Great fun so far, everything goes together easy!

73,
Scotty WA2DFI

> lower case r on the display instead of C.

Seems I encoded the letter C incorrectly. Instead of 01b00h, it should have been 01a00h.

The letter "C" shows up on the display while "Y" is being sent by the side tone, then it changes to 'r'. So, it is easy to miss seeing the C flash by.

Lower Tuning limit doesn't work: It works if your single steping the frequency. Seems it can miss it when in fast tune mode. Looks like if there is a 50 Hz remainder in the frequency, when fast tune starts and uses 100 Hz steps, the 50 Hz never gets tested and therefore can skip by the test. Let me see if I can fix that for the remander of the kits to be sent out.

72, Steve

I got it to where I'm convinced it functions, have to drop it now as I have my own 60+ hr work weeks.
I'm really pleased with the tradeoffs Steve made on this one. Two bands on the main board, display, AGC, only five easy toroids, altoids tin sizing, great price. My only regret is I'd prefer an MSP430F5132 for the additional flexibility it gives. Perhaps we should move the code base to C so it's more accessible and easy for users to play with. Unlike many uC's, the MSP430 runs efficiently on C.
Display works fine. Yes, the enunciated "YR" is weird, especially since there's no instance of "MRS_Y" in the source code. Maybe the vendor burned the wrong firmware into the MSP430's? I've had that happen multiple times where I work, we finally gave up on the vendor and load all flash parts ourselves. But I think the MTR functions fine as is, and the MSP430 launchpad programmer/eval kit is only $4.30 for those that want to update the firmware.
OK, back to work.

I completed the assembly and calibration/alignment of the MTR today. All seems to be functioning properly. I am getting 4.5-5w out with 12.3 in from a 3s lipo pack. Have not peaked the TX filters yet for max output/efficiency. RX sensitivity appears to be good. I have not yet made a QSO, or mounted it in a case. I am debating possibly putting it in a slight larger than Altoids case, so I can include an EFHW tuner for 40/20M. I'll mull over that one a bit.

Looks good, Steve! Another winner.

My MTR kit finally showed up in the morning mail so I'm ready to get rolling. But, I have questions.

I've built SMT projects before, but I always hand-soldered the SMT components. This time, I would really like to try the SMT paste technique since it seems easier to get a high quality outcome. My question is, do you place all of the parts on the board before you heat the board? Or do you place some components, heat the board. Then add more paste and more components followed by another heating cycle. Can you do a second heating cycle or is that a bad idea?

How long can the solder paste sit on the board without heating before it starts to dry out, go bad, whatever?

Forgive if these should be obvious, I'm trying to figure this all out.

I've done it all different ways with equal results (i.e. good). Do what you're comfortable with. I use an oven if doing all parts on a side at a time or a hot air gun if doing multiple cycles. Often it's my schedule that determines what method I use.

Patiently awaiting my solder paste cause I'm just not doing it my hand anymore. :)

Hand soldering with the right fine tipped temp controlled iron works fine for me. Took about 6 hours total, including winding the coils and a very long pause before applying power. Now that I have the destructions figured out, might be 4 hours. But I do plan to try solderpaste next time.

I'm doing a number of the smt boards one side at a time, with a cup warmer, and hot air. One side at a time. That is the fastest for me. The hand soldering is left for cleanup, to touchup the contacts that didn't make it well during the solder paste. Careful application of thepaste, with a critical eye to amount deposited, with reward one, with a high percentage of perfectly soldered contacts. This is specifically, one of those times that LESS is Best.

From: Scott Cowling
Topic: 8765 Message: 8765

Hi Steve and the group,

It's alive! All tune up steps worked, but some confusion due to different button pushes needed than what the manual says.

I won't repeat the ones that Jerry found, but pick up where he left off.

Here is what I found:

Reference Oscillator Frequency Calibration, page 5:
To get into CAL mode, I needed to hold <RIT> and <Tune Up>, not <RIT> and <Tune Down> when I powered up the rig.

Like Jerry says, you hear "YR": in Morse, then see "r" on the display. Adjustment is per the instructions.

When you are done and hit MENU, you hear "YO" in Morse, then see "o" on the display.

LO trim on page 13 then follows OK.

As Jerry mentioned, BNDA and BNDB are reversed both in the "Receiver Input Peaking" section and on the schematic.

On page 21, under the "P" section, I found that the <Tune Down> button turns the Morse annunciate on and off, while the <Tune Up> button saves the state of the rig.

Also, on the schematic, I think that the toroids are mis-marked:
L11 should be L10
L12 should be L11
L13 should be L12
L14 should be L13

Nothing earth shaking once you figure it out. Finally, here are my TX measurements:

40M: 9V@440mA = 4W out
40M: 12V@560mA = 6W out
20M: 9V@440mA = 4W out
20M: 12V@630mA = 6W out

spreading/squeezing doesn't seem to have a great effect.

Measurements taken with Elecraft W1, to nearest watt. Will try this again tomorrow with NorCal QRP wattmeter to nearest 100mW.

I'm not convinced that I am really getting 6W out. :-)

73,
Scotty WA2DFI

8766. beverage warmer source?

I think they are all about that same shape, which makes it tricky identifying a "good" one.

I took mine apart, and found that the plastic on top ensures that the metal plate touches the heating element. Once you remove the plastic top, the metal plate just "floats" and is in contact with the heating elements through thermal paste. Very crude design. Clearly they didn't want you to use it with the top off for SMD soldering. ;-)

I picked up an electric griddle at Wally-world around Christmass time a few years back. It's a lot begiger than whats really needed, but it was cheap ~ $19. Or check the local thrift stores and yard sales, electric griddles are common in those kinds of places for just a few dollars.

Hard to imagine the ~5 Watts from a USB port making much difference, though all that plastic may reduce convective air flow some. A 1500 Watt griddle is another matter.

John,
I have two pre-heat sources...

Presto 07211 Liddle Griddle: which is about 8 x 10 inches in size, thermostat controlled, available at Amazon and other places.

Brookstone Mug/Coffee warmer: which has a two temperature switch, the hi temp being about 200degF on the surface of the warming plate.

I've used a non-contact IR thermometer to check surface temperatures. You need to be careful not to overheat - which is possible with a "real" griddle. From what I can tell, a pre-heat in the 200-250degF range is about right, although I don't think I've every have read any authoritative literature on the subject related to SMT soldering. Beware: the "liddle griddle" does not have an accurately calibrated thermostat - which I would guess to be true for most consumer griddles of this nature. Also, my griddle swings widely in temperature until it reaches steady state. A method is needed to verify surface temperature (the IR thermometer 'guns' work well for this). In don't think the coffee warmers will get much hotter than 200degF - just short of boiling.

I find that spritzing the surface of a griddle with a few droplets of tap water a good indicator of temperature. Just wet my hand and flick.

If the drops just sit there it's below 212F. If they skitter around it's above 212F. If they boil off slowly it's close enough to 212F to pre-heat the board(s).

Just a hint to those that don't already have an IR thermometer.

This talk about beverage warmers is related to the MTR project?
Are people looking for a hot plate to solder the SMDs on the board?
If so, in the late 80s I used a flat frying pan on a stove.
Heated the pan and then quickly dropped the board into the pan.

Worked like a charm.

Smelled like Bacon :O)

Stephan;
I use a lab type hotplate (surplus sale!).
The easiest way to keep the temp at around the boiling point of water is just that!
Adjust the heat till drops of water will evaporate off without bubbling or boiling! Too hot and drops will sizzle - too cold and they sit there for a while.
It's not that critical, IMHO.
Of course, I do check with my IR Digital too - but that's more to see how accurate the Dig meter is!

Stephen,
You are correct, I think my "liddle griddle" can reach 500degF or more - a couple hundered degrees higher than the solder melting point of about 360, and likely disasterous to the components and board in general!

So, I check the temperature with a non-contact IR thermometer "gun" - and do not rely on the temperature markings on the griddle thermostat. I see the IR thermometers available in home improvement stores (Black & Decker makes one). I happen to have a Raytek model, but they are all similar. The adjustable thermostat on the griddle then keeps the temp in an acceptable range.

Mention of short switch shafts in regard to this enclosure option brings me to visualize a drilled-out depression in the aluminum that effectively countersinks the buttons of the ATS or MTR rig. Typically haven't these buttons been a slight issue with sticking up? Seems like if you're talking about 2-3mm, you could countersink a bit, within the thickness of your case material, and have a very nice result. Just brainstorming here.

I confess that I asked the question because I wasn't seeing mention of the optimum temperature for the board, nor temperatures that would damage the board. Maybe it's mentioned in your video or on Cash Olsen's page?

Putting drops of water on the surface is as good an idea as any. Water boils at 212 F (100 C), so if the drops don't evaporate, it's too cool and if they instantly vaporize, it's too hot. The usual temperature for a beverage warmer is about 195 F (90 C).

I don't throw much away, and fix most things. I took a non-working (timer failure) electric coffee maker, separated the upper water reservoir and used the warming base. Being bigger than the beverage warmer, it can handle larger projects. I put pennies under the board corners when doing the other side.

And that's my 4 cents worth. :-)

My last smt project (ATS4a) had two semiconductors that were bad and required replacement. There were also some soldering issues. It made me wonder if they were damaged by the repeated heating cycles when I used paste.

Steve has organized his build into semiconductor, resistor and capacitor placement. To me this means 3 heat cycles per side or 6 cycles total. Does anyone know how many cycles the components can safely handle? Would it make sense to place the semiconductors last if they are the most delicate? Does it help to populate an entire side before reflowing?

I'm confused by something, hopefully someone can explain.
On page 15 of the manual which contains the voltage charts, P4 of U6 is indicted at 3.3v. This pin connects to the junction of C27 and C28, which in turn are tied to the +5v line. How can this be?
In addition, C33 and C20 are tied to the same point at 5v.
Here's where it gets strange. I measure 3.3v at P4 of U6 and at the junction of C27 and C28, but I measure 5v at the junction of C20 and C33 (which also ties to R13 BTW). If I measure the resistance between C20 and the junction of C27 and C28, I get 42.6K (looks like it should be 0 to me according to the schematic).
Am I missing something really simple here? None of this makes sense to me.
I got started down this path because I am only measuring 1.75v at P3 of U6, which connects to the other side of C28. Also, I am getting 0v at P16 of U6. All other U6 voltages are ok. Are these issues related?
Any help or explanation will be appreciated.
Thanks,
Tom

8802. Swithching boost regulator

Date: 2012-04-19 15:16:03 UTC
From: Steven
Topic: 8802 Message: 8802

I finally got a chance to try out a tiny boost regulator chip I bought a month or so ago. The LMR62014 by National Semi, min input, 2.7V, max output, 20 V and 1 A. Switching frequency of 1.6 MHz and in a SOT-23-5 package. Sounded ideal to boost a single Li-ion cell to 9V to power the MTR or other ATS rig. Since 1.6 MHz isn't harmonically related to any ham band, noise from the switcher isn't an issue.

Turns out it sort of works.

It seems the problem is the max output current is directly related to the input voltage. I should have read the data sheet a bit closer.

With an 8V output voltage (the closest I could get to 9V with the resistors I had on hand) the minimum input voltage required to keep the regulation to 8V during transmit is just over 4V. This is a bit too much to get from a single Li-ion cell.

However, three AA Alkalines at 4.5 V would work. Three Lithium AA's would allow 9V output no problem. Four cells would be even better.

A boost regulator has two disadvantages. One, it's not all that efficient. 70-80% depending on current output and amount of boost. Second, since power must be conserved, the current draw at the supply side is much higher than the output current. Peak currents can be very high.

So, maybe a better approch would be a buck regulator. In this case, the input current is actually less then the output current and the efficiency is much higher, typically 90% or better. Although it would take more batteries, they could be smaller than the ones needed for a boost regulator since the required current is less.

There is buck version of this simple switcher also available, so maybe I should order a few of those to try out too...

It probably went out yesterday. I took about 40 kits to the PO yesterday. I have a handfull of DX orders to go out today (they take longer to get ready with the silly customs forms to fill out, so they tend to be last, although a lot have already gone out). That will leave a few kits left to process, the ones which wanted parts for 80M.

Rats, I forgot the change that on the schematic. Thats what happens when you recyle diagrams and voltage charts from previous editions to save work.

So, are you not getting any output from the chip? If so the usual problem is a bad connection at the reference oscillator, though there could be one at the DDS chip or assosiated parts.

Steve

Tom, the ADS9834 can run on an AVDD of 3.3v or 5v, it doesn't care.
Board clearly has ADS9834 pins 4 and 5 tied together.
So adjust the schematics by cutting the vertical wire between
the node where C27,C28 join and the 5v rail above, then tie
pins 4 and 5 together of U6. Board is as Steve intended.

Jerry, Steve,
That is what I had concluded since I also noticed that pins 4 and 5 were connected on the board - just looking for confirmation as this may confuse others as well.
I must have a bad connection somewhere as it does not appear that the AD9834 has any output at pin 16. I will have to reflow a few joints and see what happens - everything looks good to the eye, but these are pretty old eyes, even with magnification tools :-)
Unfortunately, my test equipment except for a voltmeter is still in storage from a move a while back - guess I may need to dig it out.
Thanks,
Tom

I recently received a boost-buck regulator I ordered from ebay. I haven't tried it with my 3b yet, but I did connect it to my 10.5v (8aa rechargeable cells) pack and adjust the output all the way from 3v up to 30v. I'm not concerned about trying to boost a 6v pack to 12v or buck a 24v pack to 12v, but rather my goal was just to maintain a steady output at near max voltage (I set mine to 11.5v out) to keep my signal strong as the batteries deplete. Just an idea in case you want to give that one a try.

I've driven LED strip lights at 13.8v from a dead SLA that dropped to 4v
when the boost was attached. This would not last log, but it was neat
to see that happen.

8810. Re: MTR troubleshooting question

Topic: 8799 Message: 8810

After touching up all connections on the reference osc and U6, the rig came to life and appears to be behaving as expected.
I can hear the osc at 10Mhz in another rx, and the bfo peaks (by ear). I am copying signals on 20m and the trimmers peak the noise on both 20 and 40m, and I see 4w out on the wattmeter when sending a string of dashes.
So, another MTR is alive! Now to fine tune and fully check it out.
This was my first project with this size of SM components, so it's a good feeling to see it alive! Hand soldered. Hope to make first qso with it later today.
Thanks,
Tom

This forum seems to be more about building than operating, so I hope I'm not being too indulgent by relating this here.
I just enjoyed my first QSO with my MTR on 40m. After seeing it put out 4.5w with a 12v supply, I hooked it up to the "dead" 9v battery I took out of my multi-meter a few days ago to see what it would do. Only 1/2w output on the meter, but I heard WB9VRP in IN calling CQ on 7030 so answered him. Came right back with a 579 and we had a nice 20 minute chat. VA to IN may not be rare dx for a first QSO, but it was a thrill none the less. The wattmeter needle was barely moving by the end of the QSO, but he continued to have solid copy on me. It's nice to see the rig continue to perform so nicely on a failing power source!
The receiver sounds great, and so does the keying when listening to it on another radio. This is going to be a very fun little radio. I'm tickled to have it done in time for a trip I will be making to the high desert of central Oregon (Bend) soon - I hope I can get to the top of some of the mountains with the MTR while there.
Thanks for a neat radio Steve!

The only part you should probably hand solder is the LED display. It's the only part they send me in a mosture proof bag with a humidity indicator card inside. That's an indication there could be issues when it is heated in an oven as is done with commercial assembly, though I don't think the way we heat it up is going to be problem.

From: poikaa
Topic: 8766 Message: 8820

I am using an old Fondue hotplate with a built-in temperature regulator. A drop of water is a good indicator for temperature also! I practiced on a few junker SMD boards, de-soldering, clean-up then re-soldering on the same board. Works like a champ and practice makes for better temperature control.
One could always buy an electric fry pan to use as a board heater and the non-slip surface may help. It too will have a temperature control.
I frown on beverage heaters as they are so small and because of this larger boards do not fit and they also lose their heat momentum much faster. The fondue is about seven inches (15 cms) across and fry pans can be as much as 15 inches (25 cms) or more.

I do not think it is requirement to use a hot plate to heat the board but is is a way to mass solder the components. It is a high adrenaline experience to solder each leg and pad. A hot plate makes this easy to do and most of the time the parts align them selves.
Not every one has use of a hot air rework station and the one draw back here is that there is a chance of blowing the tiny parts right off the board.
I assembled my ATS-3 in 2005 by hand and it worked very good, the rig fired right up and worked straight off! I fact I am still impressed how well the design is as the rig receives almost continuous coverage and even will transmit on 160 meters!
As components become smaller and the leads disappear under the part, I will be using hot plates or hot air. I just made a purchase of a hot air station and it is slick!

I would like to thank Steve for excellent job done regarding shipping. He is the first one who managed to outsmart Czech customs and Czech post so the envelope landed directly in my mailbox without any hassles with the above stated criminal organizations. So instead of three or more weeks delivery (out of which three or more weeks time is consumed by customs and Czech post) it took only 5 (five) days!!!! The US stamp is 12. April and I found it in my mailbox on April the 17th. Unbelievable! Plus there was weekend between 12th and 17th. I started the building process on 18th and it is almost ready today, see photo section.

It is not an absolute necessity. You can accomplish the same thing with just the hot air. The key is to warm it to the soaking zone temp for a minute or two before heating to the reflow zone. Check out the material spec sheet for Kester EP 256 solder paste.

From: Sid Leben
Topic: 8670 Message: 8826

Well this is my first attempt at SMT. As I get older I am realizing that my ability to build with thru-hole devices is waning, as most items are surface mount.
I am hand soldering the MTR and have all the IC's on the bottom & half of the resistors mounted. So far so good. Just lost (1) item so far, Q1. I'll get that when I am finished as I will probably have add'l "run aways"!

If I were younger, I would solder paste & hot plate. But for now, this is a very challenging endeavor, but I will get it on the air !!!!

Kudos to Steve, and all of you, who have made this a very interesting group..

Having built an ATS-3B with the "place one part at a time method", and having practiced a bit with the solder paste method prior to my MTR arriving, I can say that the solder paste method is far easier. Now that you're into your build, go ahead and finish it up that way; however, I strongly consider using the hot air/solder paste method next time.

I thought it was tricky for the longest time, but it's *far* easier than doing it by hand--especially with the ICs.

Thanks Steve, my 'envelope of fun' arrived today in Paris, France and gratefully also managed to slip below the customs radar!

--- In AT_Sprint@yahoogroups.com, "ok2mr" <martin.riha@...> wrote:
>
> I would like to thank Steve for excellent job done regarding shipping. He is the first one who managed to outsmart Czech customs and Czech post so the envelope landed directly in my mailbox without any hassles with the above stated criminal organizations. So instead of three or more weeks delivery (out of which three or more weeks time is consumed by customs and Czech post) it took only 5 (five) days!!!! The US stamp is 12. April and I found it in my mailbox on April the 17th. Unbelievable! Plus there was weekend between 12th and 17th.

From: Colin
Topic: 8829 Message: 8829

I'm new to the group, have looked at the ATS rigs before, but I never really had the budget (or nerves to take on the import radar!).

A guy here in the UK posted about the MTR on the SOTAwatch reflector - after reading about the MTR, I knew that I needed to have one of these! I have been playing with RockMites for SOTA in the past few months and had great results but sometimes you just feel like having better filtering or the ability to QSY.

I thought I haad initially 'missed the boat' as I hesitated in ordering and then had to convince my XYL that I really NEEDED another radio :-)
Steve confirmed to me last Sunday that my order was successful. Reading all the comments so far and studying the manual is really making me look forward to seeing the package arrive on my door mat!

I intend to hand solder all the components - I am at home with this method. I have been building an SDR today using 0805 size parts and I was really pleased with my work. A Hendricks SMK-2 arrived yesterday, so I will build that as further practice, although the SMDs are quite large looking (1206?)!

I can't wait to take my MTR on SOTA outings!

Welcome Colin,
I'm new here too, and as a proud owner of an MTR, please let me reassure your XYL that you DO, in fact NEED to have one of these rigs.
After building half a dozen SoftRocks, this was my first ATS build, and I was a little anxious about working with the smaller parts too - my 62 yr old eyes aren't the greatest any more. In reality, I think the smaller parts are actually easier to hand solder than the larger ones - they just go down real quick and easy, and the quality of Steve's board is so good.
Have fun building and climbing mountains with your MTR! Hope to work you MTR to MTR from one of our mountains here in VA.
73, Tom N0BS

I soldered my ATS3B by hand. Am contemplating using solder paste for the MTR, but wondering whether obtaining the tools is worthwhile for one project, and whether some simpler SMD work would be needed before trying on the MTR.

The manual in the files section has *most* of the corrections in it, at least as far as actual construction goes. I'll up load what I belive is the final, definative, error free manual later tonight. I think the only thing which was left to correct was the DDS voltage table and the 5V power connection shown on the schematic, which should have been to the 3.3V bus

Colin that would have been me!

I'm still awaiting my MTR which will become my main SOTA rig . That means I can keep the ATS4 as my main home rig! I kid you not. I have not used another HF rig this year and have racked up 270 SOTA chaser points on my ATS4.
In the field the ATS4 has been on 4 activations with 250 QSOs in the log and 37 DXCC. It's a super SOTA rig. I've no reason to doubt the MTR won't be every bit as good.

http://youtu.be/SqgS0rQvaus

Look forward to working you on the MTR S2S..
Off in a few days time to GI and taking the ATS4 with me, hoping that time and weather will allow a couple of GI activations.
That could be a first for one of Steve's rigs.

The tools to assemble a SMT project like the MTR with solder paste solder are not that expensive. I purchased an "embossing gun" at the local craft store for about $12. This is the gentle hot air source. A small griddle was snagged somewhere else - I forget - for I think about $20. I had a non-contact IR thermometer in my tool kit already, but they are available for less than $50 (if you want to monitor griddle temperature more closely than the "sizzling water drop" method).

One could buy a "SMT rework station" for several hundred dollars - but this is truly overkill. However, I've been tempted.....!

I'm considering using solder paste for building my MTR rig...not going to use the hot plate method but thinking about using my heat gun.

I have an Ungar heat gun with two heat settings....790F and 1200F.....which of these settings would give me the best results???

Many thanks for any info.

NO NO NO NO NO NO !!

DO NOT use a heat gun. The results will be a disaster and fit only for the trash can.

First, it will blow the parts off the board and if any happen to stay put, you will melt them in no time! SMT parts do not like sudden changes in temperature, which is why it is recommened to let the board heat relatively slowly and uniformly across the board by using a hot plate. The embossing heat gun is low heat and has a gental air flow, a fraction of what a "normal" heat gun (or hair dryer) produces. It also produces a fairly focused air flow. Just enough hot air is used to rise the temperature of the past to melting which is about 450 degrees.

Joe,
I don't have experience with the Ungar heat gun, but I would approach soldering with *great caution* with this tool. I have a Black & Decker heat gun that looks similar and is appropriate for stripping paint, but I foresee a couple of problems using it for SMT work:
- higher velocity hot air blow may literally blow the parts off your board
- solder paste melts at about 360-370F, I'm thinking at 1200F you may literally blister and/or melt the circuit board and components - the lower temperature may be more appropriate, but lots of *caution* keeps coming to mind

The whole soldering process with the hot plate/embossing gun is designed to preheat the board/paste/components with the hot plate to around 200F, then gently nudge the temperature up to the solder melting point - and back quickly off once solder has flowed.

So back to your question, my inclination is to say "neither temperature - the Ungar tool will cook your work!"

If you proceed, try to figure out a way to test it - perhaps melting some solder paste applied to a reject circuit board from something else?

NO NO NO NO NO NO !!

DO NOT use a heat gun. The results will be a disaster and fit only for the trash can.

First, it will blow the parts off the board and if any happen to stay put, you will melt them in no time! SMT parts do not like sudden changes in temperature, which is why it is recommened to let the board heat relatively slowly and uniformly across the board by using a hot plate. The embossing heat gun is low heat and has a gental air flow, a fraction of what a "normal" heat gun (or hair dryer) produces. It also produces a fairly focused air flow. Just enough hot air is used to rise the temperature of the past to melting which is about 450 degrees.

Steve

Steve;

Thanks for that update warning, I found an "embossing heat gun" that looks and feels like something which is intended to just "lightly melt thin plastic onto art mold areas", but I haven't tried using it on solder or solder paste.

My next item is to find a hot plate that is recommended, that's an item which I've never experienced, either. Looks like I'll do some searching on Amazon or the Internet, to get ready for the day that I can practice with a few things that need to be looked at.

Here I was, pencil soldering iron on the bench, ready to send really hot points from a spot to whatever SMT part is in mind, and it appears that I'd be frying almost anything I put some heat to! I'll make the transition from "Elecraft, give it plenty of heat for the tiny job", to "little heat gun, just touch the part with a gnat's breath".

Thanks, 73's

Many thanks for the input/suggestions about not using a heat gun with solder paste.

Will have to investigate a hot plate and embossing gun if I decide to go with the solder paste method.

Just a reminder that ovens & paste are not the only way..
As long as you are not mass producing or in a hurry, Old fashioned soldering works on SMT projects just fine

I have enjoyed building several ATS projects with just a soldering iron and a hand made "Duffus"
BTW, I wear a 4x magnifier hood when doing this.
Wick gets used a little especially on the real crowded IC pins. The end result always looks supurb.

Here is a duffus on my work bench..

Here it is pinning down some work ..

Here is a close in on the duffus construction..
that is just a clothes hangar and a fishing weight and a ball point pen spring holding a toothpick
(not my design, I think I stole the design from this list a long time back)

Hi all,
I use the Aoyue 853A pre-heater and solder the components with the Ayoue 6028 hot aire gun. those are usfull tools.

The reflow oven is not good because it has no internal air flow for heating the bottom and top at the same time. No uniform temp on the hole PCB surface.see,

8851. MTR Altoids template

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-21 17:23:08 UTC
From: Tom
Topic: 8851 Message: 8851

I decided to try an Altoids tin for starters as an enclosure for the MTR. I found that if you just wrap the template over the edges of the can for the side panel connectors, this results in them being too close to the board (yes, I printed it full size). I will have to file those holes oblong to get enough space to mount them - kind of sloppy - I may just start over. If you go this route, I recommend drilling only the front panel holes (all these came out fine), trial fit it in the can, and then decide on the position of the side panel connector template independently of the front panel. Also, I would offset the antenna connector a bit more to the side of where it connects to the board to gain a little more wiring room. Everything is a tight fit, but it does make for a cute and compact package. YMMV.
BTW, I found that a Stihl chain saw sharpening file is the ideal tool for filing holes to size and cleaning up the rough edges made by drilling. It is a very fine pitch file and just the right size to allow good control when filing the soft thin metal.

Possibly on this forum, but maybe another, someone suggested a way of creating rectangular holes in mint tins.

Mark out the required opening on the tin, draw diagonal lines from the corners, drill at their intersection, and then cut from that hole to each corner with a jewler's saw or equivalent. When that's done, fold the 'triangles' under and you have a nice looking opening, without any 'edge' issues.

I have not tried this yet, but I'm sure it will be a big improvement on my 'drill and file' work to date.

BTW, one of the perks of using the Altoid tin is that if you make a mistake on either the lid or case, you can easily separate them and keep the good part.

For the rectangular holes, I just drilled a hole the diameter of my file, and then using the file, made the hole slightly oblong to allow for the range of movement of the slide switches. If you apply a graphic template on the cover, it is easy to cut those openings rectangular and you will not see the oblong shape of the hole in the tin.
Am I missing something? There are no holes in the lid, so how would you mess it up? I thought the benefit of making a mistake on the case was that you get to eat another tin of Altoids!!

BTW Steve - how about an editable version of the cover graphic with the holes properly scaled, so that we can customize the graphics?

It occurred to me that a clear mylar sheet with the graphics and labels reverse printed on the back side of it might make a nice cover. If the top gets scratched, just print a new one and replace it.

I am a bit confused as to the amount of reflow (solder paste) construction that can be used. I have order paste from Cash Olson, an embosser heater from the local craft store and a coffee mug heater from an online source so I will be using a method that has brought success to many on this group. My question involves what side of the board gets done with this method? My feeling is to do the side with all the resistors and capacitors and then hand solder the side with the IC's. I can't see a way to safely do both side using the hot air reflow. I have 10 years experience doing smt rework by hand soldering so either way can be made to work for me. After 10 years of hand solder rework I can say that it's not that much fun so help!

Hi, Do both sides.. the second side is chosen to have the fewer components on it.. and it is done second.... leaving less time for the higher populated area to get hot, from the hot air.. and have gravity take over... So.. the cup warmer should be no more than 200 degrees, and the time spend using hot air on the second side, planned, and most of all.. after everything flows on that second side.. DO NOT MOVE the board, until it cools enough to have the solder solid. Then immediately inspect carefully the heating surface for little critters that expected to get away.

Won't be any problem, Dave, if you keep the warming surface not more than 200deg F, and don't dislodge any of the components on the bottom side, with being too anxious to pick it up.

I just started to test Dig1 mode on my ATS4 (original). It sends a "p" for a space. I see in the forum that folks were looking for new firmware. Did that ever happen? Can somebody send my the firmware?

I do as others here do and put pennies under the corners of the board when I'm doing the second side. I don't know if it's absolutely necessary, but it does allow the board to be preheated, without the soldered components contacting the hot plate surface.

The key is that the hot plate is preheating everything, to avoid stresses, and the embossing heat gun is focused on the components you want to solder. The preheat temperature is about 200 F and the embossing gun is about 680 F.

>> Hi, Do both sides.. the second side is chosen to have the fewer components on it.. and it is done second.... leaving less time for the higher populated area to get hot, from the hot air.. and have gravity take over... So.. the cup warmer should be no more than 200 degrees, and the time spend using hot air on the second side, planned, and most of all.. after everything flows on that second side.. DO NOT MOVE the board, until it cools enough to have the solder solid. Then immediately inspect carefully the heating surface for little critters that expected to get away.

I have order paste from Cash Olson, an embosser heater from the local craft store and a coffee mug heater from an online source so I will be using a method that has brought success to many on this group. My question involves what side of the board gets done with this method? My feeling is to do the side with all the resistors and capacitors and then hand solder the side with the IC's. I can't see a way to safely do both side using the hot air reflow. I have 10 years experience doing smt rework by hand soldering so either way can be made to work for me. After 10 years of hand solder rework I can say that it's not that much fun so help!

From: kd5kxf
Topic: 8871 Message: 8871

My first experience with the soldering paste construction went well... with one exception. I toasted two trimmers. I got a little aggressive with the heat gun, possibly got it too close. Two of the little guys slid and the screw on both caught solder pads. I got them off with braid and iron but there was no way to get all the solder off the screws. I will hand solder the replacements in once I find replacements. I have seen a few questions on how to do the other side. I started with the bottom and all of it's IC's DDS etc and then used 3 pennies under each corner of the board to heat and flow the other side. Looking forward to putting power to it.

8873. Have you used lead-free solder paste?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-23 11:06:07 UTC
From: ohwenzelph
Topic: 8873 Message: 8873

Hi,

Several years ago I had tried electronic kit building with lead-free solder and a hand held soldering iron, with through the hole parts. I found I liked the traditional eutectic lead tin fluxed electronic solder much more for hand soldering, much easier and nicer to work with, lower melting point and turned out better in general.

With the ATS kits I can do a good enough job with tin lead solder paste but wondered how different lead free would be and if there are any tips to compensate for the differences.

I use the cupwarmer/embossing gun method for surface mount. Solder paste dries quickly once it is exposed to air, so I've always tried to finish one side of a board in a few hours. Is this necessary? I'd prefer to build the top side on the MTR over several days, but I want to make sure the paste will perform properly once it is heated.

The key to that is easy, you can put the components on, then let them sit over night, put more on the next day, after putting the paste on the next day's locations. Or, another way to say it, is to only paste what you can put components on that day. I suppose it would be possible to put the board into a sandwich baggie, and place it carefully into the refrig. I'd be very concerned that the board would be disturbed, after the frig light went off the first time. Murphy works in the dark too.

Does one side need to be completely populated before heating or can it be done piece meal with several heating cycles? I know that the components are tough, but is there a limit?

I suppose you can reheat, and reflow all the solder connections again and again... however, that process may introduce issues that you may not want to deal with, as incomponents that move, shorts that occur, basic Murphyisms. With good temperature control to not exceed the norm, you shouldn't have any issues... however, if you are considering reheating the board to reflow, say 10 - 15 times... I'd recommend you find a builder that can build it for you with two or three heats.

I have tended to do a small 'square' that's maybe 1"x1" or a bit more. I put on everything that is in that area. I do this because, while I find the hot air/solder paste method to be much easier for me than hand soldering, I still start feeling a bit stressed after a half hour or so.

When I've got a square populated, I put it on the warmer for 3 or 4 minutes and then use the embossing gun to focus on the components I've sent in the paste.

On the next square, the area of the first square will also be warmed by the warmer, but I try and focus the embossing gun, which is a much higher temperature, on the 'new square'. I'm sure that the embossing gun does heat up some of the previously soldered components a bit, but I've never seen one move or change appearances in any way.

As a side note, someone here mentioned they melted some trimmer capacitors with the air gun. No doubt. I've only built the ATS3B and hand soldered all of the components on the filter boards. I gather that the filter components are on the MTR main PCB. I would hand solder on any plastic components, once the rest of the board is fully populated.

There is no "one right way" to build an SMD kit.

That is encouraging to know and will get a launchpad on it's way. It sounds like you may have done this. Any recommendations on software that will handle the in-circuit programming for the SPI by wire? I did see that Steve grouped a few connections in the upper left of the MSP430 on the schematic. I'm guessing the test and reset signals are the ones of interest. Maybe when the smoke settles from kit shipping, Steve will post the latest code.

When you order the Launchpad, you should see links to download the IDE. I have only used the IAR Embedded Workbench version so that's the one I recommend.

Here is a link to the LaunchPad main page:

http://e2e.ti.com/group/msp430launchpad/w/default.aspx

You will need to connect the test, reset, and ground wires from the LaunchPad to the MTR board, then use the IAR software to download firmware. I haven't done it yet with the MTR, but will, as soon as I get it built. Soon after that should have a version of my firmware available for the MTR. Of course, kids and family may delay .....

No. Only 3 lines needed for the MTR. You can see them above the MPU chip on the board. You will need new hardware to plug into your USB port (TI LaunchPad will work and it's only $4.30). You probably will need to update the IAR Workbench if you're using the old one that I reference on my website.

No, paste that has dried, yet not been heated is fine, no problem when heated, it however, does lose its stickiness that will tend to let components that were placed, slip away.

Subject: [AT_Sprint] Re: Solder paste question

I wasn't planning to put paste on the board unless I was mounting a component. I was wondering whether solder paste that had dried for several days before initial heating would compromise final quality of the solder joints.

Thanks,

Michael KD4SGN

Mike is correct. The LaunchPad will only work with the latest release of the IAR workbench. The latest version of the firmware is already in the MTR folder in the files section. I should probably add the IAR .prg file which has the options setup configured for the chip.

Although you can get a Launchpad directly from TI, they make you jump through hoops to do so. It's much easier to get one through Mouser or Digi-Key, although it will cost a little more. (it was like $5.03 plus postage - go priority mail there).

The latest firmware only fixes a bug which allows the rig to tune beyond the tuning limits in the case of having a 50 Hz step in the frequency and I belive that only applies to S/N of less then 90.

Steve
No. Only 3 lines needed for the MTR. You can see them above the MPU chip on the board. You will need new hardware to plug into your USB port (TI LaunchPad will work and it's only $4.30). You probably will need to update the IAR Workbench if you're using the old one that I reference on my website.

It's on the little piece of paper that was sent with your kit. Maybe 2" x 3" or so. Inside the envelope.

I don't believe it exists anywhere else (unless Steve KD1JV has a record of them).

8895. Heating PC boards for SMD soldering

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-24 18:32:33 UTC
From: k6jeb
Topic: 8821 Message: 8895

Why heat the PC board and components before using the hot air to flash the solder paste?
It serves to ramp the temperature up for both the pcb and the components to a threshold temperature; from there you take the specific parts/area of the board over the solder paste melting temperature without having to hold the hot air on it very long. This protects the components and seems to be more to spec with regard to the solder paste itself.
For you guys looking for a heating pad, I actually prefer the electric skillet I bought years ago at Target (just for this purpose). It's bigger than a coffee warmer, has sides so just in case you pull a newbie move like I did and blow a part right off the paste, it doesn't go very far. I actually place the SMDs on the paste/pcb IN the skillet, which makes a decent work space (you can prop your hands on the sides when you have the tweezers). Of course this placement takes place BEFORE you plug the skillet in! hi hi!
Of course you can try NOT using the pre-heating,but it will take a lot more application of heat from your hot air source. It actually is what you can and sometimes have to do when you have to rework a circuit. There are specific tools for that however and that task merits its own discussion.
I try to take my skillet/pcb up to about 200 degrees F and then plateau there, get the hot air (embossing tool) heated up and get ready for the fun. Keep the barrel of the thing pointed down-range (in a safe direction).
Oh and by the way, when you do the second side, you can prop-up the pcb on pennies to keep the bottom-side components (that you've already soldered) from shifting. And don't forget to NOT use this method with any through-hole parts, especially including USB ports (ahem, a little lesson I learned with the recent build of a Softrock SMD at a NorCalQRP Buildathon). I usually do the side with the LEAST parts first since if they do get jiggled and move when doing the more populated side, there's less work. Know that sometimes, you simply have to do some components by-hand, and that's OK too since none of us should be afraid of soldering a couple SMDs.
You can get plenty of practice with this method by taking apart an old computer motherboard or something such. Practice getting the right amount of paste on to the pads so the part pulls-in nice and centered (that's a really wonderful result of doing it this way versus soldering each pad by hand). There's almost that moment of alchemy as the paste turns bright and shiny. I demo this at clubs and it lights-up even the most latent builders in the group. Through-hole is a blast, but being able to delve into SMD the way hams have has opened a lot of new doors for exploration.
Rather than go to Target or elsewhere, most of you probably have spouses who have one of these skillets that hasn't been used in years/decades.

Use your best judgement on whether to ask for permission or for forgiveness. hi hi!
The hot-air method is a great way to get a lot of parts on the board quickly and the results, when done right, are superb.

8901. Another ATS03b on the Air!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-25 03:16:18 UTC
From: Lee Hiers
Topic: 8901 Message: 8901

I know I'm several years behind, but I was able to purchase an unbuilt ATS-3b this past summer, and finally got around to working on it this past weekend. So far I've only built the 40m band module and need to do some tweaking to get my power up, but other than only getting ~2w on a 9v battery, everything worked perfectly first try! Had my first QSO after only a handful of CQs.

Thanks to Chuck, WA6LTV, for showing me his '3b in a "Sindy" Altoids tin - he did exactly what I had in mind: to mount the switches on the reverse side of the board for access through the tin's lid. So, I copied him. Unfortunately, my workmanship is nothing like his - his builds are inspirational!

More at aa4ga.com.

I'm just tickled pink!

There might have been some discussion on rouge characters being sent via some sort of CW status. I think you mentioned you might have fat fingered some bits in a register location.

Anyway, I was able to order the Launchpad and also a USB development dongle.
 https://estore.ti.com/EZ430-F2013-MSP430-USB-Stick-Development-Tool-P800.aspx
I ordered the second one just because. I have a few perks as my employer has a development relationship with TI. Enter in a code and poof, shopping cart balance goes to $0.00.

The latest firmware only fixes a bug which allows
the rig to tune beyond the tuning limits in the case of having a 50 Hz step in
the frequency and I belive that only applies to S/N of less then 90.

Steve
No. Only 3 lines needed for the MTR. You can see them above the MPU chip on the board. You will need new hardware to plug into your USB port (TI LaunchPad will work and it's only $4.30). You probably will need to update the IAR Workbench if you're using the old one that I reference on my website.

8903. MTR - BUG ALERT

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-26 05:00:11 UTC
From: Steven Weber
Topic: 8903 Message: 8903

Okay, this is a suttle but serious bug which was just uncovered:

Problem: Transmits local messages - such as frequency annunciation.

Casue: Clicking RIT switch and releasing it before activating RIT or not selecting a message to transmit within 1/2 second. - A flag which enables transmitting messages in the morse out routine is set as soon as the message select wait loop is entered. Unfortunetly, the flag is not cleared if the loop times out.

Short term fix : try not to release the RIT switch before either RIT is activated or you select a message to send. Even a blank location will work.

If the rig starts to transmit local messages, (which will be hard to tell unless you have something to monitor power output all the time) the flag can only be reset by either transmitting an actual message (or blank location) or cycling power to reset the rig.

Long term fix: This is a real question as how to best handle. Gonna have to think about it, but my first though is I'll have to send everyone a new processor. Bummer.

I think many of us will be fine with using Launchpad to reburn flash. The GNU tools for OSX or Ubuntu are a much cleaner install than IAR or CCS on MSWindows. Might be possible to create a small software package to update the MSP430 that's easy to download and run.

Another consideration/option. Purchase a new MCU from one of the reputable sources and send it to Steve for programming. Then you'll get practice removing the original SMT PCU. Of course, that could be destructive - I would just get setup to reprogram the MCU myself.

8911. MTR - BUG FIX

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-26 15:12:25 UTC
From: Steven Weber
Topic: 8911 Message: 8911

This BUG is serious enough I feel it must be addressed. We can't be accidently transmitting the local messages.

One of the problems is it has to be done before May 15, when I leave for Dayton, which doesn't leave much time. After FDIM, I'm heading for the AT to hike for a couple of weeks. Then at the end of June, I'll be heading out to Montana for 2 months on the CDT (Continental Divide Trail). I'll be home for a few weeks in early June, but most that time will be spent getting ready to go west.

I will go ahead and buy a bunch of new processors to send out.

1. All the DX orders will get one for sure, because of the expense of sending the original back. These are thin enough that they can go into a standard letter envelope, so the postage is reasonable and avoids customs and those hassles.

2. If you already built the board and don't want to re-flash the chip yourself, put the board in a small box and mail it to me. I'll re-flash the chip and then do the calibration and alignment of the board for you, along with any minor repairs if needed to get it going and pay return postage. What a deal!

3. Anyone who hasn't built the board and willing to pull the chip out of the package and send it to me to re-flash, that would be a big help. Thankfully, I packaged the processor seperately from the rest of the semiconductors so it's easy to find and get to. You can snip the end of the pink bag and slip the chip out. The processor is of course the long skinny part behind the piece of white card. The other chip there is the DDS chip.

When mailing the processor, first fold a small piece of tin foil around it for static protection, then tape it to some thin cardboard, like from a cerial box and have a piece on both sides of the chip. This will help keep the leads from being damaged by the postal machines. You put it in an letter envelope and mail it for 45 cents.

4. Everyone else I'll send a new processor.

I'll hold off ordering new chips until Monday. In the mean time, let me know if your planing to send me your board or chip, so I'll know how many I need to order on Monday.

Steve

If we have ordered the board from TI, is it simple for us to reflash the chip ourselves?

I haven't built mine yet, so it's not on the board.

Just wondering if this saves you time, money, effort, Steve.

steve.kd1jv@... writes:

This BUG is serious enough I feel it must be addressed. We can't be
accidently transmitting the local messages.

One of the problems is it has to be done before May 15, when I leave for
Dayton, which doesn't leave much time. After FDIM, I'm heading for the AT
to
hike for a couple of weeks. Then at the end of June, I'll be heading out
to
Montana for 2 months on the CDT (Continental Divide Trail). I'll be home
for
a few weeks in early June, but most that time will be spent getting ready
to
go west.

I will go ahead and buy a bunch of new processors to send out.

1. All the DX orders will get one for sure, because of the expense of
sending the original back. These are thin enough that they can go into a
standard letter envelope, so the postage is reasonable and avoids customs
and those hassles.

2. If you already built the board and don't want to re-flash the chip
yourself, put the board in a small box and mail it to me. I'll re-flash
the
chip and then do the calibration and alignment of the board for you, along
with any minor repairs if needed to get it going and pay return postage.
What a deal!

3. Anyone who hasn't built the board and willing to pull the chip out of
the
package and send it to me to re-flash, that would be a big help.
Thankfully,
I packaged the processor seperately from the rest of the semiconductors so

it's easy to find and get to. You can snip the end of the pink bag and slip
the chip out. The processor is of course the long skinny part behind the piece of white card. The other chip there is the DDS chip.

When mailing the processor, first fold a small piece of tin foil around it
for static protection, then tape it to some thin cardboard, like from a cerial box and have a piece on both sides of the chip. This will help keep the leads from being damaged by the postal machines. You put it in an letter
envelope and mail it for 45 cents.

4. Everyone else I'll send a new processor.

I'll hold off ordering new chips until Monday. In the mean time, let me know
if your planing to send me your board or chip, so I'll know how many I need
to order on Monday.

Subject: [AT_Sprint] MTR - BUG FIX

This BUG is serious enough I feel it must be addressed. We can't be accidently transmitting the local messages.

One of the problems is it has to be done before May 15, when I leave for Dayton, which doesn't leave much time. After FDIM, I'm heading for the AT to hike for a couple of weeks. Then at the end of June, I'll be heading out to Montana for 2 months on the CDT (Continental Divide Trail). I'll be home for a few weeks in early June, but most that time will be spent getting ready to go west.

I will go ahead and buy a bunch of new processors to send out.

1. All the DX orders will get one for sure, because of the expense of sending the original back. These are thin enough that they can go into a standard letter envelope, so the postage is reasonable and avoids customs and those hassles.

2. If you already built the board and don't want to re-flash the chip yourself, put the board in a small box and mail it to me. I'll re-flash the chip and then do the calibration and alignment of the board for you, along with any minor repairs if needed to get it going and pay return postage. What a deal!

3. Anyone who hasn't built the board and willing to pull the chip out of the package and send it to me to re-flash, that would be a big help. Thankfully, I packaged the processor seperately from the rest of the semiconductors so it's easy to find and get to. You can snip the end of the pink bag and slip the chip out. The processor is of course the long skinny part behind the piece of white card. The other chip there is the DDS chip.

When mailing the processor, first fold a small piece of tin foil around it for static protection, then tape it to some thin cardboard, like from a cerial box and have a piece on both sides of the chip. This will help keep the leads from being damaged by the postal machines. You put it in an letter

envelope and mail it for 45 cents.

4. Everyone else I'll send a new processor.

I'll hold off ordering new chips until Monday. In the mean time, let me know if your planing to send me your board or chip, so I'll know how many I need to order on Monday.

Steve-
My MTR is assembled, the easiest thing for me to do is mail it back for reflashing. I don't know how to reflash-- someone flashed me once, but that is another story...
Will put it in the mail tomorrow unless I hear differently.

Using the Launchpad is pretty easy, all you'll need to do is make a little 3 wire jumper cable to go from the LP to the MTR. I'll write a little instruction paper over the weekend so you don't have to wade through TI and IAR's instructions for the software.

MTR group,

Since I have to reflash or send new processors to everyone, I decided to add a new feature while I was at it. (hopefully bug free :) It's just a "power on" indicator by lighting up the decimal point on the display, which otherwise isn't being used for anything.

After running a battery pack down by leaving it pluged into the rig over night, I figured having a power on light might be a good feature to have, even though it adds a couple ma to the current. If you do want to save that couple of ma, the power on light will be easy enough to disable by removing the resistor (R34) which is in series with that led in the display.

Steve KD1JV

Steve -

Perhaps you could make the decimal point "blink" - reducing battery drain in half and perhaps getting more attention to see that the rig is "on"...

Thanks,
Etienne

Interesting video...the hot plate reached temps of 360F plus and the solder paste melted easily.

I assume the solder paste on the previously mounted and soldered components melts again....does this cause any concern overall??

Does the above method used in the video have any advantage(s) over using a hot plate at lower temps plus the embossing gun to melt the solder paste???

The method in the video seems like an easier way to go....but not having ever used solder paste before I'm just guessing.

Steve;

I got a bit of a surprise today, another package came from you, and it turned out to be the MTR, S/N 092! This is a much smaller package than the earlier one of about two weeks ago, which I thought was the MTR, but it must be a late delivery of an ATS version... So, considering the efficiency of the Pony Express these days, I "finally" got the one last ATS, and now have the MTR in hand.

Will wonders never cease.

Took time out to find and download all the files for the different versions, so my printer will be working overtime, unless I do the intelligent thing and take the manual(s) to the one office to have the pages printed on a machine that can handle the load easier and cheaper than "Kodak and their expensive inks".

Now, to wait for "revisions to firmware", swap notes with Dale on how to do that myself, if possible, and make an old man's attempt to do today's little bench tech on a tiny thing that I really need trained ants to handle.

Hi Steve,

My MTR is about 50% built so I will either flash it myself or send the board to you once it is done.

I suppose this is a reason to learn about the MSP430 (add to the collection of PICs, AVR, Freescale, etc)

Thanks for the great product & support.

In fact Steve I should thank you for the bug.
That will give me a good reason to play with the MSP430.
I read your procedure and understood it had to be reprogrammed inline so it is powered by the MTR board.
I also found this page describing how to use XCode IDE (Mac OS X) to reprogram it, so I just have to wait for the two parcels to arrive...
http://processors.wiki.ti.com/index.php/MSP430_LaunchPad_Mac_OS_X

Maybe somebody that uses IAR regularly could try out the
instructions in the file "MTR flashing with launchpad.pdf
I didn't have much luck.

I downloaded the "code size limited" IAR software from
http://processors.wiki.ti.com/index.php/IAR_Embedded_Workbench_for_TI_MSP430
Just that compressed install file is 134 MBytes.
Once IAR's up, I didn't see the File/Open/Projects menu
selection mentioned in the pdf file. I assume that should
be more like Projects/Add_Existing_Project
Unfortunately, the provided MTR.eww doesn't seem to be a
project file, I assume it should be something like MTR.ewp.

The MTR_2.s43 file seems to be IAR specific, as the include
files are not compatible with the GNU tools for the MSP430.
So you'll probably need access to an MSWindows box to burn
flash under IAR unless somebody that knows what they are
doing can port this to Ubuntu and/or OSX.

The MSP430 processor core is really clean, the on chip
peripherals maybe a bit more difficult to figure out than
they should be, and the IAR (and CSS) software environments
are unfortunately badly bloated.

I got the replacement trimmers in the mail today (thanks Steve!!!) and installed them tonight. Started testing and found signs of life... display was not right. Checked joints on it and resistors and on the processor and decided to touch up some on the processor. It got a bit better. Decided to get out my higher power magnifier... hmmm it all looks ok but saw a gleem between two pins. Hit it with the braid again and tried power again... beautiful, glorious red lcd as supposed to be. Just got through peaking the band trimmer on 40, very nice receiver. I will peak 20 tomorrow and put it in the case and on the air for QRPTTF. I don't care how many rigs I build... it is just magic when you peak a trimmer and that CW just starts rolling in. Thanks for the help and hints guys, hope to work some of you this weekend.

Thanks Steve, kit S/N 131 arrived in the mail yesterday.

I'm not very confident with the whole programming business, so will appreciate the new chip. I will extract the old chip from the kit and mail it back.

Thank you for putting together such a great kit, I can imagine how much work putting together a kit like this involves, your efforts are very much appreciated.

I don't have my rig with me now, but using IAR looks easy enough.
Will try to get back to it Sunday or Monday.

Steve's MTR.eww file is apparently a workspace file.
I think you can just go into IAR fresh, create a new workspace,
then a project, add the MTR_2.s43 file, then Project/Rebuild_All

> the include files are not compatible with the GNU tools
Need to change this line in MTR_w.s43 #include "msp430F2132.h"
to #include "msp430x21x2.h"
but there's still a few things to fix, as assembler syntax
for the Gnu tools is a bit different.

> unfortunately badly bloated
To a guy that started out on a PDP8 with 4k of core and paper tape.

Hi Steve,

I have a Mac and don't do programming as a rule. I took a shot at downloading MacPort for OSX (seems required) but it did not go smoothly. The instructions must assume just a bit more Mac skill than I have so I could not get the MSP430 development code to install etc. As much as I would like to get my feet wet on reprogramming the Chip, today I will be sending in the chip for exchange - SN 105.

I'm posting this as a kind of shot-in-the-dark, but what the heck. I am in San Francisco with my XYL, for her Master's commencement Saturday (Golden Gate Univ.)--naturally I brought my well-traveled 3B and necessaries for QRV in Golden Gate Park, or Henry Cowell Redwoods--somewhere when I have a couple hours. I set the rig up in our hotel room to make sure I'm ready to roll--and the rig's deaf! It powers up perfectly, all functions fine. Xmit seems to work w/ 11.7V from my battery pack. I hear plenty of hiss from the audio amplifier in earbuds and external powered speaker--but no response from touching the antenna connector as usual.

-connection from board to antenna rca jack center connector OK
-tapping on various connections with a alligator clip gives clicks in the headphones--I know they're good, and impedance is correct

I don't have the ability to solder or really troubleshoot this rig, but I do have an Autek RF-1 that sends 'chirps' to the rig when it's used to check antenna swr nearby (NOT connected physically to the rig).

Is there something I'm overlooking, or is there an ATS-friendly ham in the area? We are in the union square area until Tuesday afternoon. Email me **off-list** if you might be able to help in person, or maybe there's some way I can bring my RX back?

Oh, well, it's a great trip without QRP, but everybody knows how much fun it can be WITH?
Thanks,
Jonathan KC7FYS

Hi Ben,

Yesterday I made some research and it seems the main documentation about using the MSP430 with OS X is outdated (but still works).
You have better infos here :
http://processors.wiki.ti.com/index.php/MSP430_LaunchPad_(MSP-EXP430G2)
As far as I understand, the easiest way is now to use Energia (Arduino port) that will install everything you need :
https://github.com/energia/Energia/downloads
After that, if you'd like to use XCode as IDE, you can install the template for it :
http://embedxcode.weebly.com/

About the LaunchPad. Yesterday I tried to order one.
My first attempt lead to an error on the website, so I did a second one and it works.
Today I received nice emails from TI telling me that I have 2 launchpad shipped...
4.30$ is not a big deal but still too much regarding my HAM radio budget and needs.
I will have hard time to explain to my wife why I have ordered twice the same thing!
Next step is too find someone to give the spare LaunchPad to...

73,
Yan.

Looks like it's a lot easier to do the flash once the chip is installed, versus when it's loose, right Steve?

Yes. The way I flash the "raw" chip is to press it against the pads of an un-populated board, which just has a by-pass cap on the supply line. In this case, the Launchpad also supplies power. In order to get the pins to line up with the pads, I have a guide mounted to the board to set the bottom of the chip against. Sort of like the ruler guide I show in the manual, but perminately attached.

Holding the chip against a board is the same way I programmed the larger SOC processors, but since the leads are farther apart and somewhat larger then the TSSOP, it was easier to get them aligned. Thankfully for the TSSOP chips, all the connections which have to be made are on the same side of the chip, which helps a lot.

This works *most* of the time, but when doing a whole lot of chips at a time, my finger gets real sore pushing the chip hard enough against the board to make reliable contact. If I get a miss program, I have to unplug the USB cable to reset the LP board. If I try to restart the download without resetting the board, I get a "communications error" and "Debug session terminated" error messages. I'm not sure if that is a bug in the Launchpad, the IAR IDE or the way my USB works in my PC, but it is a pain each time it happens.

I've tried to devise mechanical means to hold the chip in place, but in the end it turns out to be quicker to just use my finger! Getting a commercial socket of some kind to hold the chip is just insanely expensive.

I can attest that at 200 degrees on the hotplate with 3 pennies as spacers under each corner, I did not lose any pieces off the backside while I hot air gunned the top side. That would be my concern at the higher temps... knocking pieces off and ending up with smd stirfry in the bottom of that skillet. I cannot imagine how bad getting some r's and c's and a dds or processor all stuck together unstuck would be... my guess is it would be a show stopper.

On a standard sized cup holder at 200 degrees, with the boards spaced off the surface two pennies high, I've found I can do 4 boards at a time, stacking the active part of the board in the open and overlapping the part of the board I am not working on. The temp drops off the more boards stacked, yet, a tad longer with hot air, and the solder paste flows just fine. The key to that is air flow control and temp of the air. Too hot too quick maybe a problem because you may introduce undesired heating and cooling differential problems in nearby areas of the board, or toast the board. Take your time, and be patient. It all flows together. 200 F on the heating surface, works well.

From: radio_kx0r
Topic: 8766 Message: 8971

Several years ago I bought my "embossing tool" (= hot air SMT device) at Hobby Lobby. While in the store I walked around looking at things for sale, and in the Candle Department I found a variety of candle warmers. This are like cup warmers. They are used to heat fragrant candle wax that is put up in glass containers.

When I tested my candle warmer, I found that the surface was almost hot enough to boil water. The heat wasn't perfectly even across the surface, however. I made a heat spreader out of a piece of aluminum plate 1/4" thick. I supported it on coins.

I plugged the candle warmer into my bench variac, turned it up to 140VAC, and then water drops danced and spattered across the surface of the aluminum plate after it warmed up. The device is just a resistor, and it can take 140V OK for a while. The aluminum plate takes 10 or 15 minutes to come up to temperature, but the heat is very even.

The PCB with parts prepared with solder paste is placed on the aluminum plate above the candle warmer. Allow everything to warm up for 15 minutes or so. Then start the hot air tool, and gradually bring it closer to the parts to be soldered. Keep it moving so the heat is even over the area you want to melt. It should be approximately perpendicular to the PCB so there's no sideways air pressure on the parts. You shouldn't have to get closer than 2 inches from the nozzle of the tool. Take your time.

Once the solder paste starts to melt, you can see it shine. Use a bright light and magnification so you can see what's happening. Be sure that all the parts you need to solder actually melt.

It's worth practicing with a scrap PCB or a simple project.

It's probably best to heat and reflow the most complex side of the PCB first. You can do the entire side in one session, or perhaps 2 sessions.

With the candle warmer adjusted correctly - just above the point where water drops dance - and the PCB up on coins, when you reflow the top side of the PCB with the hot air tool, the parts on the bottom won't reflow. This is true if you are careful and avoid excess heat on the top side. Again - take your time - getting the hot air tool too close to the top side could overheat the PCB and damage it, and also could melt the parts on the bottom.

I'm real skeptical of using skillets and such, because the temperature can go higher than what we need for the preheat part of the process. This could be a real problem, because the bottom side might melt while reflowing the top side.

Whatever you use, the guideline of using a temperature that causes water drops to boil and skitter - but no more - seems OK.

Hopefully some of the rest of you can add to this. In any case it worked for me. Unfortunately I haven't done any of this work since I built my ATS-3B, so I'll have practice before doing the MTR.

Use a bright light, strong reading glasses, and plenty of coffee or tea...even old hams can build surface mount radios!

From: radio_kx0r
Topic: 8766 Message: 8972

There is a pretty good photo of my Candle Warmer with the aluminum heat spreader hidden in the Photos section of this website. I just found my tools here, and what I used was a thin aluminum plate on the candle warmer right under the 1/4" thick plate. The coins were only used for the part when I flipped the board over and reflowed the second side.

The reason for the coins is to avoid pressure on parts just in case they actually reflow on the bottom side. They actually could reflow on the bottom side, but they probably won't move if there is no pressure on them. Surface tension will hold them.

I'll use this same setup for the MTR.

KX0R

>
> Several years ago I bought my "embossing tool" (= hot air SMT device) at Hobby Lobby. While in the store I walked around looking at things for sale, and in the Candle Department I found a variety of candle warmers. This are like cup warmers. They are used to heat fragrant candle wax that is put up in glass containers.
>
> When I tested my candle warmer, I found that the surface was almost hot enough to boil water. The heat wasn't perfectly even across the surface, however. I made a heat spreader out of a piece of aluminum plate 1/4" thick. I supported it on coins.
>
> I plugged the candle warmer into my bench variac, turned it up to 140VAC, and then water drops danced and spattered across the surface of the aluminum plate after it warmed up. The device is just a resistor, and it can take 140V OK for a while. The aluminum plate takes 10 or 15 minutes to come up to temperature, but the heat is very even.
>
> The PCB with parts prepared with solder paste is placed on the aluminum plate above the candle warmer. Allow everything to warm up for 15 minutes or so. Then start the hot air tool, and gradually bring it closer to the parts to be soldered. Keep it moving so the heat is even over the area you want to melt. It should be approximately perpendicular to the PCB so there's no sideways air pressure on the parts. You shouldn't have to get closer than 2 inches from the nozzle of the tool. Take your time.
>
> Once the solder paste starts to melt, you can see it shine. Use a bright light and magnification so you can see what's happening. Be sure that all the parts you need to solder actually melt.
>
> It's worth practicing with a scrap PCB or a simple project.
>
> It's probably best to heat and reflow the most complex side of the PCB first. You can do the entire side in one session, or perhaps 2 sessions.
>
> With the candle warmer adjusted correctly - just above the point where water drops dance

- and the PCB up on coins, when you reflow the top side of the PCB with the hot air tool, the parts on the bottom won't reflow. This is true if you are careful and avoid excess heat on the top side. Again - take your time - getting the hot air tool too close to the top side could overheat the PCB and damage it, and also could melt the parts on the bottom.
>
> I'm real skeptical of using skillets and such, because the temperature can go higher than what we need for the preheat part of the process. This could be a real problem, because the bottom side might melt while reflowing the top side.
>
> Whatever you use, the guideline of using a temperature that causes water drops to boil and skitter - but no more - seems OK.
>
> Hopefully some of the rest of you can add to this. In any case it worked for me. Unfortunately I haven't done any of this work since I built my ATS-3B, so I'll have practice before doing the MTR.

Anyone try a coffee carafe warmer? Like:
http://www.capitalcityrestaurantsupply.com/prodDetail.cfm/1589830

Would provide a bit more surface area. I have not found temperature
information, but I suspect they keep temperatures below boiling,
probably around 190F or so.

Subject: [AT_Sprint] beverage warmer source?

Hi all,

I was wondering if anyone has a good, reliable
beverage warmer they

can recommend. I picked up this device at a Radio
Shack sale some time

in the past, but the board doesn't touch the
warmer, so the heat is

never transferred.

http://www.tulsasuperads.com/electronics_For_Sale/C513A274151P5/JOURNEY_S_EDGE_2_0_USB_Bev
erage_Warmer.aspx

Is there some way I should "modify" the beverage
warmer so that it

touches the board, or are there other beverage
warmers out there that

are better?

In anticipation of the MTR kit arriving, I did
some solder paste work

with a few other projects that came in the mail
recently. I'll never

go back to soldering by hand of SMD parts, when
possible. Of course, I

was only using the hot air gun and not a beverage
warmer beneath.

Worked fine, but I can imagine using the warmer
would decrease the

time a bit.

Thanks.

8974. ATS-4b: confirming which manual to use

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-28 19:34:51 UTC
From: Owen B. Mehegan
Topic: 8974 Message: 8974

HI gang -

I have an unopened ATS-4b kit, which I purchased from Doug/K9DLP in January. I'm going to get started building it in the next week or so, but I wanted to confirm something Doug mentioned before I do (and before Steve heads out into the wilderness for a few weeks :). Doug said that this kit is from a run made before the final one, and as such I should use the manual included with the CD that came with it, rather than any newer one found on the Yahoo group's files section. I guess later runs of the kit may have included minor changes, so I want to use the manual that goes with my run. This seems logical to me, I just wanted to make sure before I start soldering! Should I refer to the errata document in the files section, dated 11/27/2011, if need be? Or is that also specific to the last run of this kit?

Many thanks in advance!

Owen/KJ6AKQ

Hi Owen, I'd go with the cd, after checking the errata, and using the updated by you, information. Most of the errata doesn't affect things, but if you pay close attention to details and get hung up on everything everywhere has to match, check the errata. That'll catch all that. And in the process, you get more familiar with the manual, and the radio.Win - Win.Have a great build!!

8978. MTR impressions after field use

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-29 05:28:39 UTC
From: kd5kxf
Topic: 8978 Message: 8978

I took MTR sn 089 out for QRPTTF today. I worked a qso with it last night to be sure it worked before I packaged it into the altoids tin. My impressions of this rig are very favorable. I was careful to avoid the rit button after confirming with a dummy load the local message transmission problem. In practice this was not difficult to avoid and the rig worked great. I did not use any messages, I just didn't have time to upgrade the firmware before the contest today. The audio is more than adequate, I used some cheap over the ear walkman style headphones instead of earbuds and it still had more than ample audio even with the high winds I was in today. The keyer and basic controls are well thought out, I really like the audio annunciated freq readout too. Anyone who has operated any of the ATS series will be right at home with the quality and the functionality. I have operated for 4 hours off of a 4.2ah lipo cell and the power is still above 12 volts so it is obviously efficient. Since I have had other ATS rigs and the PFR3, the rig felt very much "like home". I will probably do a formal calibration when I take it out of the tin to upgrade the firmware, I merely set the BFO by ear during the test qso last night. I have operated it on both 20 and 40 meters. I am very happy with this rig and would have to rate it extremely high on the bang for the buck scale. Hope to catch one of you MTR guys soon for my first 2x MTR qso.

Mike KD5KXF

8983. Is K5WTA part of the group?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-29 18:51:59 UTC
From: Milton A Riutort
Topic: 8983 Message: 8983

Hi

I was testing a new home brew vertical near 15 GMT here and after few resonant test the antenna was showing a good 20m band SWR and I pickup the ATS4 for a quick test. Two station was logged, W4P and K5WTA, both in FL with good signals reports.

Jack, if you are part of the group email me to let you know exactly my working condition here.

Anyway, the antenna is one element trap save from a big (apparently a KLM fabrication) ship to shore multiband yagi that was disassemble into pieces for sell as aluminum material. Only this band trap piece survive. We just mount it into a aluminum tube and start seeing in what frequency does it resonate. At this moment it is working on 14,200Khz and 10,400Khz. This make me very happy, because I think we can adjust it down what is needed, to make it resonant on 30m band with a little capaciting hat. If this works, I can use it as my perfect MTR match antenna here at home. The MTR is assembled for 20m and 30m bands.

Will see..!

Best 73,
Milton

Actually, if you've already calibrated, you don't have to do it again. The F2xxx series chips have four, 64 byte memory blocks instead of the two 128 information memories the earlier F1xxx series used in previous ATS flavors.

The programmer will errase three of these information memory blocks (although it is possible to set the options so that none are errased). The 4th block contains oscillator calibration data for the MSP's DCO, so it is left intact. I used this same information block to store the DDS calibration data in, leaving the other three for the keyer memories.

This change in how the information memory works and modifying the routine for that change is what lead to the bug causing the local messages to be transmitted. So, for those of you who were wondering if this bug affected earlier ATS rigs, no it doesn't.

Steve, KD1JV

Thanks, Steve. I noticed that the DDS was still calibrated when I went back through the routine. At that point, I thought it prudent to just continue with the "recal" just to make sure the DDS cal and BFO offset were re-stored properly.

I added some photos to the KD5KXF folder in photos. I did a couple of things to this thing to make it work... namely taking another set of contacts from another identical switch and taking the drift pin out and removing the toggle arm so I had a through mount hole for the wires. I did not have the nut so I soldered the switch frame and threads to the altoids box. I am going to build a couple of other variations and will post the results. I am absolutely please with how it operates though. Pretty nice score for .99 each.

Hi Steve
Serial #045 is up and running. Generating appoximately 4 watts with 10 volts on both 20 and 40(Elecraft W1 wattmeter). Seems to be performing properly. What a wonderful little kit/rig. I will return the board to you by UPS in the AM and will include return postage. Thank you very much for this service of reflashing the chip and using some electronic "bug spray". Hope the Hamilton is still running.

Hi,

I am wondering what paddle do you use when on a trail?
I am rather new to CW and my only paddle is a Black Widow from W5JH.
I am really pleased with it. It is not perfect but fit me well.
I'd like to buy the baby black widow Jerry made for the PFR or KX1 but Jerry no longer sells paddles kits...

I am looking at the K8RA P2Jr and AME PortaPaddle but the truth is that they are over my current budget.
I am ready to wait a little bit more and buy a good paddle but I would like to have advises from experimented QRPers...

I am sending at 15-20wpm and have a light touch.
That said when going portable I can make effort to send slower even I find it boring...

Thanks for your help.
73,
Yan.

You might consider the Te-Ne-Ke from the North Ottawa (Michigan) ARC.
The unit is often mounted on a heavy base for use in the home shack, but
is easily removed to use with a leg strap when out in the field.

See http://w8cso.org/index.php?page=teneke for details and a link to a
brochure. Note you may pay several ways, including PayPal.

Reviews on e-ham may be found at http://www.eham.net/reviews/detail/527

72/73 de n8xx Hg

p.s. I'm not a member of NOARC, have no financial connection with the
group, but I've seen the key in action, it's seems versatile and useful

My experience has been that no one makes a small enough, light enough paddle if you are taking it on the trail. At 15 to 20 wpm you are right where I am. I usually run around 17wpm to 20wpm and it doesn't take Bengali precision to send those speeds. My first paddle was the Ft Smith Paddle/Keyer kit and the whole thing fit in an altoids can. This was used with rigs with no keyer like my SST or SW+. I then built several single arm paddles using pcb and hardware. My current one is made out of an older SPST switch. You can see it in the photo folder labeled KD5KXF. Total cost was $2.16 so it fit my budget well too and took less than 15 minutes to make.

Another option is the Whiterook Products MK-44.
It is small, weighs virtually nothing, works amazingly well, and is quite durable - all in spite of being constructed of plastic and simple components.

Nice paddle... if it is the one I am thinking of though, isn't it mag mount? I used a friends with a K2 and it wouldn't mount to the K2 because the case was aluminum. Worked like stink stuck to the tailgate of the truck though.

Someone else mentioned the Whiterook. I haven't tried one so can't comment.

I have had the tiny tenekey in the 35mm canister and it is great. Wish they still made it. I had the other one that is back in production and it is an amazingly good feeling key. I could run that one 25wpm+ with no problems. It however did not respond well to being thrown in the backpack and it ultimately died in the line of duty.

But for something that I throw in a backback, I am looking for something light, durable, and replaceable. I forgot the Hauff portapaddle... that thing is nice and under $50.
I used a paperclip key for a while too...

My favorite is one I made with PVC and a piece of double sided and some 440 screws. That ugly brute will probably never die and darn sure no one is going to steel the thing but it works well. You just have to put something on a round handheld key so you can orient it in the dark or you will grab it upside down and send dots instead of dahs etc. The single lever paddle goes inside the pvc and you put screws in as contacts and wire the paddle common and the screws for dits and dahs. You can drill
a whole to adjust the action of the lever.

And these things with a a light rig and other light accessories means it can fit in tiny spaces and gets to go numerous places. My hunting trips usually involve QRO quantities of hunting gear so whatever I take has to be small and able to survive some rough treatment from time to time.

8998. Tuners to go

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-04-30 17:46:51 UTC
From: kd5kxf
Topic: 8998 Message: 8998

Since someone asked about keys, I would like to hear from other ATS owners about what antenna and tuner solutions you use. I seem to have built a small collection of these things. I used the QRPKITS SOTA tuner for QRPTTF and was pleased with the performance and ease of use.

What are you using and why? These kind of conversations are always thought provoking to me. Currently I favor the End Fed Half Wave if I am planning on a single band or two band effort. I like the ease of installation, the options of putting it up as an inverted v, sloper, L, or vertical, and the ability to package the tuner in a small format.

I used to use a 20 meter half wave inverted V fed with 300 ohm tv twinlead and a BLT.

Attachments: 1 described; binary payloads are missing from this source WARC

Hi Yan,

I have used Whiterook, HamKey, Bencher, Kent,
Vibroplex, AME, Begali, N0SA roughly in order of
my preference. (I am sure that there are others...)

I have also used homebrew paddles made from lever
switches, hacksaw blades, and PCB material, as
well as touch switch paddles. None of these were ever more than toys.

Some of the old Heathkit keyers with built-in
paddles are OK, some not. (The Heathkit HD-1410
takes the award for the absolute *worst* paddle I
have ever used, even worse than my Vibroplex
Champion bug converted to a paddle).

Anyway, what counts to me is "when I sit down at
the home station, which paddle do I use?" It is
the AME. Which do I use with the FT-817? The AME.
Which do I use with the ATS-4B? The AME. There
is a pattern there somewhere. :-)

The high end paddles look very nice, key very
nice and are a joy to use. But you would never
take them out into the field. And the "solid"
feel of the AME paddles is exceptional, rivalling
the high end paddles (I'm sure I'll get some
arguments here :-). And they are almost
indestructible. And you can get one that weighs only 2.5 oz. (about 70g?)

My advice would be to save for the AME - you will
not be sorry. You will enjoy it every time you sit down to operate your rig.

There are as many opinions as there are paddles - mine is just one.

73,
Scotty WA2DFI

Mike,
I am also a big fan of the EFHW for all the reasons you mention, plus it just seems to work so well. I use the Hendrichs SLT+ tuner - cuz that's what I've got :-) and it works - and Steve designed it. I do find that it exhibits some hand capacitance reaction when tunung, but not a problem. The resistive style bridge in it is a good match with the MTR, as Steve suggests where you may have a severe mismatch until tuned up.
I may add one of the BLT's to the kit just to add some versatility and to experiment with other arrangements, but for portable, I think that simple = best.

Steve or others...
I am finally getting to finish constructing my ATS4 and was going to replace the R38 w/ the 1k resistor for the switching circuit (as in the instructions). If I follow the ideology of putting the 15M parts (low pass filter caps and 2nd harmonic traps, etc.) in the 15M slots and then populate, 17M, 20M and so on; shouldn't I leave the 3.9k resistor in the R38 and put the 1k for 17M in R-39 and populate the 20M resistor in R40 and so on? As always scrounging for time.....Tim

Great event Dale,

Thank you for setting it up.

I love this radio stuff !

http://ats-sprint.blogspot.com/
Check this out... !!!

On the Saturday evening... this coming July 21 US time,.... but 0000z July 22... zulu time, oh man... oh man... this is going to be so much fun!!
We can all get together... and have a sprint. Gather up call signs of many of the folks that have similar radios... of the same family, The ATS family.

oh... and you had better watch the exchanges too... because there are some of us that have more than one of these marvelous fantastically fine, and
awesomely spectacular...(huh?... oh.. ok).. simply spectac.... (huh?.... oh... ok).... they are daggone good. (There happy now?)

So the exchange from the same station could be a 1, 2, 3, 4. Just not at the same time... maybe alternating.

All kidding aside, tell your friends, tell your neighbors, and anyone else... and make plans now...
Steve KD1JV may be able to get on with us too.. check the rules... there is a bonus for that too.

See you in the ATS-SPRINT!!

But don't bring your "BIG" rig... that don't don't hunt here!!!!

Have a great day!!

I use the KI6J EFHW tuner. It doesn't exhibit hand capacitance. Also, it uses a better transformer ratio, a true efhw whereas the Hendricks version is for something else. No "counterpoise" is necessary.

However, neither one will tune 15 mtrs EFHW as designed. I am able to make the KI6J work 15-40 by using only the smaller section of the variable capacitor. The problem is too much stray capacitance to tune 15 as is.

Mike,

I am also a big fan of the EFHW for all the reasons you mention, plus it just seems to work so well. I use the Hendrichs SLT+ tuner - cuz that's what I've got :-) and it works - and Steve designed it. I do find that it exhibits some hand capacitance reaction when tunung, but not a problem.
The resistive style bridge in it is a good match with the MTR, as Steve suggests where you may have a severe mismatch until tuned up.
I may add one of the BLT's to the kit just to add some versatility and to experiment with other arrangements, but for portable, I think that simple = best.

Since someone asked about keys, I would like to hear from other ATS owners about what antenna and tuner solutions you use. I seem to have built a small collection of these things. I used the QRPKITS SOTA tuner for QRPTTF and was pleased with the performance and ease of use.

What are you using and why? These kind of conversations are always thought provoking to me. Currently I favor the End Fed Half Wave if I am planning on a single band or two band effort. I like the ease of installation, the options of putting it up as an inverted v, sloper, L, or vertical, and the ability to package the tuner in a small format.

I used to use a 20 meter half wave inverted V fed with 300 ohm tv twinlead and a BLT.

You put the 1K resistor where ever the 17M band will end up and the approperate resistor for each band in the slot where that band goes.

Most people go either 80/40/30/20/17 or 40/30/20/17/15

In any event, the highest frequency band has to go in the 15 meter slot (right most position), be that 15 or 17 then deceding order to the left.

Home made, no cost, 8 grams, used reeds from a 40's vintage relay.

Seen here in use on QRPTTF this weekend. Tuner seen is by KI6J, but in a hendricks box. Antenna is a true EFHW, no counterpoise at all, here goes out on a fishing pole about ten feet, then hangs down using a firetower as a reflector. to the northeast.

QTH W5N/PW-022, Barillas Peak firetower, San Miguel County, New Mexico.

Station is pre-wired, LiPO battery is mounted on the back. Attach antenna, stick earbuds in ears, and have at it.

"the Hendrichs version is for something else" ??? Can you explain what you mean by this comment please?
What makes it a "true" EFHW?
Hendrichs offers 2 different tuners aimed at EFHW, the SOTA tuner and the SLT+ tuner.
Which one are you referring to?
Were you using this setup on W5/SE011 when we worked the other day? QSB was a bit deep on 20m but you had a good signal into VA.
It varied all the way from S1 to S9 during the short while I heard you.
Thanks and 73,

I am referring to the SOTA tuner. in the notes the suggested wire length is not a half wave. a long radial is also suggested. It is referred to as a counterpoise, but it is RF hot so it's a radial, an antenna laying on the ground. The turns ratio does not convert the approximate 3,000 ohm impedance of an end-fed halfwave to 50 ohms which I imagine is why the suggested wire length is not a halfwave.

Stu uses a different turns ratio in the transformer to reach (I think) a 60:1 transformation. My wire is 33 ft 10 inches long made of 22 gauge teflon wire. I don't use an end insulator, QRP. I use a nail knot made with monofilament to attach a short piece of bright red mason's line, followed by fishing line known as backing.

All this rolls up on a Coleman clothesline reel. When there IS a tree (low altitudes like 10,000 foot peaks), I can throw the reel over a limb and pull the wire up. Later, I disconnect the wire from the radio, and reel it all right through the tree winding it up.

Typical deploy takes eight minutes, typical take down about four. When doing SOTA's on Fourteeners, you need to be able to get out of there fast. Clouds form over the peaks in minutes, and turn into lightning storms incredibly fast. I need to be able to pack up fast, and run out of there!

QSB is typical of what happens on a high peak. Some of the signal goes down slope and reflects off the far field bouncing skyward. At far distance then, it randomly combines with the skywave, sometimes adding and sometimes cancelling.

Yes I was using a low EFHW that day. Cerro Grande is a 10,000 ft peak with a barren top, just a grassy peak. A forest fire last summer took out the forest on its flanks, but the peak was barren before that, probably from lightning sparked little fires.

My system is optimized for use as a trail runner. Most of my peaks lack any trees, so I have to carry my support. And I impose upon my system a two pound maximum total weight restriction so that everything is light enough for me to actually run with it, up hill, sometimes to as high as 14,000 feet elevation.

No BS. Neat call sign ;-)

Here is my running radio pack I use either an ATS3B or an ATS4B. The 3 system is about five ounces lighter, but not as convenient for use in something like QRPTTF activity! ...

Thanks for the explanation Fred. I have the SLT+ which I am sometimes able to get a match with no counterpoise attached, but I figure it can only help, so I usually attach one.
I don't have the manual or schematic handy, but will do a more detailed comparison when I get a chance to see how the designs differ. I have no experience with the SOTA tuner.
Sounds like you have a nice setup. We don't have those big high peaks out here in VA, but the tops are often exposed and can be subject to sudden thunder and lightning storms in the summer, so you keep your eye on the wx.
Hope to work you S2S with my MTR sometime! I may also get to do some "big hill" activations from central OR in June if time permits while I am there.

I've done something similer in the past, using a modified clip board. I removed the clip from the top of the board and remounted it 4-5" lower so I could mount the rig and a paddle at the top of the board. Then a battery pack gets mounted to the bottom side.

Steve KD1JV

Great photographic testimonial for the ATS-4 Fred - I love the pre-wired perf board "desk". Do you ordinarily just set that in your lap in a seated position when you operate (when there's no fire tower) or ??? I'm definitely ergonomically challenged at this point and searching for clues ;-)

9015. ATS3 ergonomics

The answer to your direct question is, yes. So much depends on the hill. Out here, low hills, as in, less than 12,000 feet, and down to about 9,000 feet, are forested. I usually can find a rock or fallen tree to sit on, and put the pre-wired set up on my lap.

Lower hills, less than around 9,000 feet, are often barren desert hills, just cactus, and maybe low juniper trees, no logs. Sometimes rocks... hopefully!

And higher peaks, to 14,400 feet, those are above tree line, but there is usually a rock to sit on.

The ATS4 set up is very convenient and quick, but a bit heavier than the ATS3B set up.

Right now, my ultra-lyte set up with the ATS3B is done thus: I mount the EFHW tuner to the pole with a rubberband. I use a male RCA plug out of it, and that plugs directly into the ATS3B, no feedline, no adaptor.

The, I made an adaptor from the ATS3B DC plug to Anderson powerpole, and that plugs in directly to a tiny one inch plastic box in which I have a SPDT center off mini-toggle. Using series diodes, I can run the DC from a 3S LiPO directly through, or through one dropping diode, or through four dropping diodes. That lets me cut the voltage way down for tuning up, down a little when the battery is fully charged (12.4 volts), and full throttle after it has discharged a little bit.

In that arrangement, I mount a paddle (micro te-ne-ke to a 3x5 piece of perfboard for logging and sending.

Hope these ideas help you get a handle on your ergonomics!

73, Fred - kt5x

first photo shows back of perfboard with the micro te-ne-ke mounted, and rotated beneath a protective plastic cover during travel.

second photo shows key rotated out for use, log sheet, etc.

third photo shows arrangement for pole mountaing ATS3B with tuner and voltage controller.

Great photographic testimonial for the ATS-4 Fred - I love the pre-wired perf board "desk". Do you ordinarily just set that in your lap in a seated position when you operate (when there's no fire tower) or ??? I'm definitely ergonomically challenged at this point and searching for clues ;-)

Dale, perhaps we can round up a few users in this area and have a group effort. I wonder how many are in this area? I am not one for group activities like field day but think this might be a great group hams.

I am south of Colorado Springs, a few hours from you. I wonder which park, summit or area would work for a group?

Topic: 9017 Message: 9017

Doug said he just tested his SOTA tuner with a 33 ft 10 inch wire and got it to tune. I wasn't able to get the LED to go out with the ratio suggested, it would dim, but not out. My ground may be enough different from out there on the coast, we have no ground ;-) that it behaves differently. I have found that different sites tune a little differently.

In any case, I have both one of Doug's SOTA tuners, and one of Stu's tuners, they are essentially the same. The transformer ratio is different, Stu uses a transformer ratio I think of 23:3, that I have had more success with. I am not an engineer, so I can't say which is really more effective. Shux, if you have either of these tuners, if you have any trouble tuning a half wave, you can easily fuss with the ratio on your core until it works in your situation.

I think the impedance of a halfwave is over 3,000 ohms. That calls for a 60:1 transformer to match it to 50 ohms. That's why most tuners can't handle it. Even when they appear to handle it, they may be just disappearing the SWR in heat.

I want to also share that I could not tune a halfwave on 15 meters with these tuners. It turns out there is too much capacitance even with the variable cap at minimum. I disconnected the larger section of the capacitor reducing the minimum capacitance, THEN they tune 15 meters, even so, barely.

Meanwhile, at the other end, to my astonishment, I was still, just barely, able to tune 40 meters as well. And now all tuning is much easier since the tuning is effectively finer!

Must admit, I really like the EFHW for these little ATS radios on SOTA peaks, and these tiny tuners are one way to make them behave!

73, fred

I did not know this one.
Really nice design and it gives me idea for my homemade temporary paddle.
The price is similar to the AME DCP and I am a bit worried about how durable are the two springs when moved from place to place, so perhaps I will go for the AME, but I still have time to convince myself.

Yan.

I can't use an electronic key because I screwed up the rhythm by using a Vibroplex bug for 30+ years, so I can't vouch for any paddle. But, these folks have been making these for >10 years, and they continue to sell, so they must be useful.

I didn't know the Witherook and they are nice.
However price is in the same range than American Morse (Hauff) and you lack some adjustments.
I think for this kind of design I can try to do it myself...

Good topic idea.

My own idea (still have to check it) was to build a GP using a tripod (you can find some cheap ones here) with a 5m fishing pole on top of it.
One wire for radiant, eight 2,5m wires for radials. If the fishing pole is too short I will use linear loading.
I use a similar design for my GP at home and it works really well.

My own usage will be closer to "field day" than trail, so weight is not that much a problem.
I can bring a tripod and a 6Ah sealed lead acid battery for example.
I just need something easy to set up and that does not draw to much batteries.
My main concern being the police (or army in some places) coming to check my authorizations.
I will have everything ok, but the landlord or the hotel owner will not be pleased with attracting attention...

Hi Yan,

I am a single-lever paddle guy, so I use a Portapaddle for field work
and a Bushwacker for the "big rig" at home.

At any one time, I have several rigs set up at the operating position
(isn't QRP great?)

So I have the Bushwacker hooked up to the Omni VI, the N0SA single
lever hooked up to the IC-703+ and a J38 connected to a Wilderness
Sierra. Also sitting on the desk is a 40M Rockmite with no paddle
connected. :-)

The Portapaddle is packed in my "field bag" with the ATS-4B and the MTR.

So many rigs, so little time! :-)

Whichever one you choose, you will have fun with it!

Topic: 9017 Message: 9028

In a transformer (as in the EFHW tuner designs), the impedance transformation ratio is the square of the turns ratio. So... to use your 3000:50 figures: impedance ratio of 60:1, take the square root for the turns ratio, or 7.75 for the turns ratio. This could be a 3 turn primary and a 23 turn secondary. Some prefer an 8:1 ratio, some prefer a 10:1. It depends on a lot of factors. Experimentation can lead you to what will work best for your own conditions.

Anybody with an interest in EFHW tuners should read AA5TB's excellent page on the subject. Google AA5TB EFHWA will get you there...

9030. St. Louis Paddle (Which Paddle?)

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-01 04:53:20 UTC
From: david gauding
Topic: 9030 Message: 9030

Hello Yan,

You might find this St. Louis Paddle project useful. A .pdf is attached. My late friend Andy Becker, W0NVM and I designed it together in 2000. Paul Harden NA5N did the artwork. Doug Hendricks, KI6DS reprinted the article in the Winter 2000 issue of QRPp.

I made a few changes and improvements over the years but still use and enjoy this paddle. It's low-cost (cheap?) and serviceable in the field or at home. I prefer two-handed paddles because on the trail it is hard to find perfect spots for the radio, a desk-top paddle and my butt in the same location. The SLP also plugs right into a portable station I built around an old DSW-20 xcvr. This is a useful option.

I usually operate CW between 18-22 WPM. The single lever SLP works just fine in that range. The last SLP built here was 1/2" shorter than the original. This tightened up the action significantly. I also scrapped the lightening hole in the arm and used thinner brass stock. My latest "handle" is a small diameter plastic pill bottle that will just take a common 1/4" panel-mount stereo jack.

We weighed the complete paddle assembly once. I don't remember tonight what that was but it sure wasn't much. We thought at the time that would appeal to long-distance backpackers. A very light and flexible cable was salvaged from a computer mouse.

Builders need to have patience, a vice and a "third hand" to hold parts in place for soldering. Tedious is exactly the right word! Once the gaps are set the paddle is pretty much maintenance free unless you do something dumb like step on it. Which without elaborating is why I kept two in my field kit. <g>

I bought an AME Mini-B paddle kit about two years ago and right after they were announced. It's an excellent portable paddle, probably the best available right now but as you know very pricey. I modified this paddle slightly for two-handed use by adding a base plate and using short set-screws.

The SLP was my portable paddle of choice for a good ten years and will still be dusted off from time-to-time. If you decide to build one I'd be interested hearing about the experience.

Best regards,

Dave Gauding, NF0R

Hi Dale,
Great news, I will forward it to the medias I know.TIme frame is also good to me with some propagation probability to the US, even if July is harder than march for example.

73,
Yan.

Check this out... !!!

On the Saturday evening... this coming July 21 US time,.... but 0000z July 22... zulu time, oh man... oh man... this is going to be so much fun!!
We can all get together... and have a sprint. Gather up call signs of many of the folks that have similar radios... of the same family, The ATS family.

oh... and you had better watch the exchanges too... because there are some of us that have more than one of these marvelous fantastically fine, and
awesomely spectacular...(huh?... oh.. ok).. simply spectac.... (huh?.... oh... ok).... they are daggone good. (There happy now?)

So the exchange from the same station could be a 1, 2, 3, 4. Just not at the same time... maybe alternating.

All kidding aside, tell your friends, tell your neighbors, and anyone else... and make plans now...
Steve KD1JV may be able to get on with u s too.. check the rules... there is a bonus for that too.

See you in the ATS-SPRINT!!

But don't bring your "BIG" rig... that don't don't hunt here!!!!

Have a great day!!

Hey Dale,

I believe the guys in Colorado have an event called the 14er for peaks above 14K feet. Don't remember when it is but perhaps using that event as a trial would prove interesting.

BTW, gonna work the 7QP this weekend pretty seriously just to see how well I can do.

And/or, Mount Evans? I don't recall if the road to the top of that itty bitty hill (14,265 feet or 4,348 metres) is open after dark. Of course, in the Mountain time zone, 0000Z is a few hours before sundown. I've not been at the summit since the 1950's, and if I tried it now a daze, I'd probably need three or more days to get used to the altitude, if I'd ever get used to >14,000 feet. Even back in the days when I lived in Denver, I'd get light headed on top of a 14K mountain.

Are there any W?CQC (Colorado QRP Club) members in this conference? They're very active in other events, especially Field Day, but I don't know the members who are doing SOTA activities.

They have a link to SOTA on their home page (http://www.cqc.org)

Hi Hank,

I didn☐t know you once lived in the Denver area.

My former call was KØQZ (WBØGMF prior to that) and I lived in Broomfield
from 70☐ to 79☐.

Just hearing the name Mt. Evans brings back memories of a VERY COLD field
day from atop Mt. Evans. Burrrr!

I can☐t believe we (my old friend Brian and I) hauled tube type HF gear and
a generator and supplies up that Mt.!

The 14er event is in Aug.

http://www.14er.org/

I like Mount Herman as it is easy to get to but would be open to other summits as well. I am a member if the Colorado QRP group but have never made a meeting (it is a time management/distance issue for me) and they are coming to the Pikes Peak Ham Club group to talk at the next meeting and I am working 12 to 14 hour days for the next 7 days so do not think I will be able to meet them.

I like the Mount Herman idea Dale, it is easy to get to. I have never operated from Pikes Peak or Mt Evans so I would be up for those as well. Actually, I am open to just about any area to operate from that is FREE.... hi hi

I have to start being a good boy about now in order to get clearance from the XYL.... If she passes her General Exam during the Colorado Springs Hamfest she gets a new KX3. I may be able to talk her into coming with very easliy.

9038. RE: the EFHW tuners

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-01 14:38:00 UTC
From: Mike Baker
Topic: 9017 Message: 9038

A few years ago I tried and idea that worked pretty well.

Using a T-50-6 core I wound 29 turns with taps every other turn starting at turn 4.

I then wound a primary coupling winding over the 4 turn start of the first winding consisting of 4 turns.

Those 4 turns had a tap at turn 2 and 4.

The cold end of the two windings became ground for the feed and the load.

This Autotransformer design allowed me to basically make a wide range matcher out of it.

The primary 4 turn coil had a small value air variable cap across it to tune out the reactance. 25pf comes to mind but I don't remember. Surplus Hammarlund mini air variable.

It matched all kinds of stuff pretty well.

There was another air variable with alligator clips on it that could be parallel with the 29 turn coil to tweak it if needed.

The whole thing was on a piece of perf board for testing and never made it into a case and is now lost in the clutter someplace.

Subject: [AT_Sprint] the EFHW tuners

Doug said he just tested his SOTA tuner with a 33 ft 10 inch wire and got it to tune. I wasn't able to get the LED to go out with the ratio suggested, it would dim, but not out. My ground may be enough different from out there on the coast, we have no ground ;-) that it behaves differently. I have found that different sites tune a little differently.

In any case, I have both one of Doug's SOTA tuners, and one of Stu's tuners, they are essentially the same. The transformer ratio is different, Stu uses a transformer ratio I think of 23:3, that I have had more success with. I am not an engineer, so I can't say which is really more effective. Shux, if

you have either of these tuners, if you have any trouble tuning a half wave, you can easily fuss with the ratio on your core until it works in your situation.

I think the impedance of a halfwave is over 3,000 ohms. That calls for a 60:1 transformer to match it to 50 ohms. That's why most tuners can't handle it. Even when they appear to handle it, they may be just disappearing the SWR in heat.

I want to also share that I could not tune a halfwave on 15 meters with these tuners. It turns out there is too much capacitance even with the variable cap at minimum. I disconnected the larger section of the capacitor reducing the minimum capacitance, THEN they tune 15 meters, even so, barely.

Meanwhile, at the other end, to my astonishment, I was still, just barely, able to tune 40 meters as well. And now all tuning is much easier since the tuning is effectively finer!

Must admit, I really like the EFHW for these little ATS radios on SOTA peaks, and these tiny tuners are one way to make them behave!

A transformer works fairly well. 1:1 swr may not be achieve but its a useable matching device.

I first learned about it from W5JH and WA5BDU, and used it in a couple of balloon beacon transmitters.

More here http://pages.suddenlink.net/wa5bdu/efhw.htm and

There is a cure for the summer doldrums... hot summer nights... how weeks in the city... summer... in the city.... got the answer.. I do.. and you can too.. make plans now for a simple three hour event... and celebrate the awesome magic of Steve Weber's ATS radios... they simply perform, and they do it in such a way as to let one relax, rather than get all worked up. So.. lets go have some fun, grab your to-go bag, and set up on a cool hilltop, ormountaintop, or park.... no.. not under the waterfall, maybe close.. but not that close. Check it out... http://ats-sprint.blogspot.com/ Now someone is about to ask.. just exactly how is it that the PFR3 could play in an ATS radio event?.. the answer is simple:KD1JV designed them both.. so they are all in the same extended family. And barring family squabbles... they do all talk to one another.http://ats-sprint.blogspot.com/ There has been some folks asking about multi ops... and multi radios... the answer: Sure why not? and one fellow I know of is making this the first outing for his wife, a brand new General.. to make a trip to the mountain top and enjoy the radio together.What a blast that will be. and one last thing.. Steve is going to be on the Continental Divide.. and hopefully he will be able to be on too..Make plans.. this could be a blast!!

FWIW, I built an Emtech ZM-2 tuner to go with my first QRP rig. It's rated for up to 15 watts, and tunes balanced and unbalanced antennas. It can't do an EFHW I don't think. As kitted, it's a little large, but the construction is "ugly style" so you could use a smaller enclosure. Compared to the Hendricks SOTA tuner it's a bit pricey. It has always worked great for me though!

Hank,

A end fed half-wave antenna is only purely resistive (no reactance) at it's resonant frequency. One you tune above of below this frequency you get a reactive component.

A transformer cannot get rid of this rwactive component. You need an LC parallel network or an L, Pi or T network.

Subject: [AT_Sprint] Question about impedance matching

IF an antenna has 3000

or 5000 or whatever ohms resistive why does it need to have a

"tuner?" Why not a transformer? There's no reactance to tune

out, or is there?

Just a bit curious.

Yep, I know that, I know that. But the proponents of the Half wave, end fed, often neglect that nicety.

My antenna of choices is a wire which fits between 2 convenient points, is preferably at least 1/4 wavelength long at the frequency of choice, but not more than 5/8 wavelength (if end fed) or 1.25 wavelength if fed in the center. I then use an impedance matching device to convert whatever impedance is presented by the antenna to 50 ohms resistive or there about so my rig is happy. And, I always use a ground steak or a counterpoise even if some bright person says I can "float" my rig above ground potential with no consequences. I've been "bitten" by RF enough times when I've forgotten that connection.

That's pretty much how the Par 10/20/40 works - it will work on any band from 10 through 40 as long as you have a resonant 1/2 wave of wire.

Question: Does rubbing plastic generate static electricty, and if so, is it safe to put the radio in a case of such material???

I would like to find or make a very light weight case in which I might mount a tuner, radio, AND battery, all pre-wired and ready to mount on my SOTA antenna pole.

Fred,
I have thought about a somewhat larger enclosure also. In my junk box, I happen to have a tin that originally contained General Foods International French Vanilla Cafe (coffee). It's footprint is just very slightly larger than an Altoids tin, and is slightly more than 3 times the height and volume, i.e. think of 3 Altoid tins stacked on top of one another. One could easily package an MTR, tuner, and battery in one of these - possibly a couple 9v batteries.
I had also thought about putting 2 MTRs back to back in it for a 4 band rig (assuming I might be able to get another MTR sometime in the future).
It would not be a shirt pocket radio any more, but would still be a nice, compact, "packaged station".
Maybe just go to the grocery store with your MTR or the front panel template on a piece of paper, and search the aisles for anything packaged in a suitable tin. Especially around the year end holidays there are a lot of products sold in tins.
Let us know if you find something.

Fred;

Fear not, plastic has an extremely low static electricity generation rate, which is why it's used in so many applications. Give any enclosure idea a try, and have fun! (Marine and other extreme environment areas use plastic enclosures all the time)

From: Steven
Topic: 9058 Message: 9058

I just uploaded the latest firmware for all the ATS-4 series rigs into a folder named "ATS4 firmware".

The ATS4ND.s43 file is for the original ATS-4 and has the psk space fixed so it sends a space instead of a q. It also fixes the problem with the auto shut off not working and the battery voltage not updating in some of the kits where sent out first.

I don't remember if there were any bugs which had to be fixed in the A version.

The ATS-4B firmware fixes the switch lables not showing up on the display when in keyer message entry mode.

Thanks, Steve.
I'd like to update the firmware in my first-run ATS-4, using the TI launchpad, as I just did for the MTR. Can I use the same simple 3-wire interface (Test/Reset/GND)? If so, it looks like the first 3 pins on the ATS-4 programming port?

I'm building a MTR.. and looking at the new TriBander from Doug Hendricks... Both look to be very good additions to your to-go bag. I haven't run the specs on either,but will on the MTR shortly, and the Tri-Bander won't be far behind. Both will work the new event coming up in July too. And Doug will be at Dayton, so you can get the Tri-Bander and get it built before the middle of July. For more fun:Check it out here:For a lot of fun Join the ATS QSO Party!ats-sprint.blogspot.com

Pretty well, I find that I use a set of earbuds with a volume control on them. The max level is just a bit too loud for my old ears with earbuds. The volume control isnt needed at all with an external powered speaker.

You might try some of these hard limiters with the KX1 http://www.wa0itp.com/audiolimiter.pdf They're cheap, easy and effective, all good qrp characteristics :o) and they may save your hearing. The 8 ohm output will match the ear buds well enuff.

I love this radio stuff !

9067. Ist Annual NJQRP Skeeter Hunt

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-03 02:25:40 UTC
From: Larry Makoski
Topic: 9067 Message: 9067

The NJQRP Club is announcing a new summertime operating event - "The Skeeter Hunt". The objective is to get QRPers out of their shacks for the day; and into the fresh air and sunshine, to spread their wings and fill the airwaves with "Skeeters".

While commercial equipment can certainly utilized, bonus multipliers will be awarded for those who personally home brewed their own or kit built their own equipment (equipment not built by the operator would not count as either home brewed or kit built - it would be considered commercial equipment). The inaugural event is to be held on Sunday August 12th. It will be a four hour sprint - from 17:00 UTC to 21:00 UTC (1:00 TO 5:00 PM EDT).

The theme for this year is "My favorite outdoor place". You are encouraged to operate from your favorite outdoor place and tell us about it in your Soapbox comments.

Stations who wish to be designated as "Skeeters" can get a Skeeter number by requesting one by sending an e-mail to w2lj@... Skeeter numbers would be issued from May through the day before the event.

Station Classes and Multipliers
X1 Home stations - commercial equipment
X2 Home stations - home brewed or kit built equipment
X3 Portable station - commercial equipment
X4 Portable station - home brewed or kit built equipment

Portable stations cannot use permanent antennas, i.e you can't work from your backyard, hook up to your dipole or tower and yagi and be considered a portable station. Also, portable stations cannot be connected to the local power grid - alternative energy sources must be used - solar, battery, wind, etc.

Exchange -
Skeeter Stations - RST, S/P/C, Skeeter number
Non-Skeeter Stations - RST, S/P/C, Output power

Mode - CW
Power - 5W max

Scoring -
Working a Skeeter Station - 2 points
Working a non-Skeeter Station - 1 point

Total score equals the number of QSO points times the number of S/P/Cs worked on all bands (stations can be worked on multiple bands for QSO points and S/P/C credit) times the multiplier for station class.

Bonus points - design and home brew a key or paddle specifically for the event and earn an extra 1000 points.

Suggested frequencies:
The QRP "Watering Holes

80 Meters ~ 3.560 MHz
40 Meters ~ 7.040 and 7.030 MHz
20 Meters ~ 14.060 MHz
15 Meters ~ 21.060 MHz
10 Meters ~ 28.060 MHz

These are suggested starting points, of course. Feel free to spread out and give your "Skeeter" wings a chance to do their thing.

Logs, photos and soapbox comments can be sent to w2lj@... no later than 30 days after the event. Certificates will be issued to the top scorers of each category as well as others to be determined.

A table of call signs and issued "Skeeter" numbers will appear on a page at http://w2lj.blogspot.com/.

Hope to hear and work all of you during this new event. Special thanks to the NJQRP club for their sponsorship!

72 de Larry W2LJ
QRP - When you care to send the very least!

I am working on a homemade enclosure, but don't have anything perfected yet. However, here are some suggestions. Aluminum sheets are available at Home Depot and Ace Hardware. Door kickboards are somewhat heavier, and you get more metal for the money.
Lay out desired top template, adding space for batteries, tuners, etc. if you wish. Cut a wooden block the exact size of the finished rig. Use this block to construct a practice temmplate out of sturdy paper. Determine how the sides should fold down or overlap.
Trace the outline of the paper template onto the metal, and cut as necessary . Clamp the block in place on the netal, and fold the sides down. A vice helps, a hammer can be used to tap the sides in place.
The trick is to figure out how to fasten the bottom. Am still working on this.
Of course, the necessary holes for the controls must be drilled and filed.
Will post some photos in a couple of weeks if anyone is interested.

Neither radio is really ever loud to my ears, but the AGC in the ATS4 is quite good. When Mike, KE5AKL, was on the next hill during our SOTA Trifecta last week, about one mile away, I tuned him in and he sounded like any other loud station.

I'd appreciate comments on how well the AGC performs in the ATS-3 and ATS-4. I've been using a KX1 which has been a great little radio but I'm tired of getting my eardrums blasted due to (lack of) AGC action (with RF Gain at maximum).

Thanks & 73,

Steve;

Now, you've got me a bit worried, I don't remember if I have anything like a parallel port on any of my machines. I had a fully loaded PC XT clone "many moons ago", took it to storage with a friend in another city, intending to "fake a better motherboard in it", and didn't get around to it before his "I hate all computers" wife had the garage storage area cleaned out - so MY vintage computer went to recycle! Not one word of warning, and it was still a viable machine. Never trust a pal's family, some women have not a hint of what is in their yards and houses!

All is not lost. You can use a USB port to program the older rigs you just need a USB-JTAG programmer. Available from TI or Olimex for about $150 or so (I think, doing this from memory).

I have only 1 parallel port PC left in the house myself.

That is quite an investment to program a $250 rig.

Following parallel port emulator will likely work. I was able to use it successfully with a parallel port based vector network analyzer. The emulator is extremely slow compared to a hardware parallel port, but it emulates the port fully.

Has anyone tried using one of the add-on PCI or PCIe plug-in parallel port interface cards to program the ATS series rigs?

If these work then for a few dollars the problem is solved.

Another enclosure idea. Not pocket size but has possibilities for a "station in a box". Take a look at http://radioset-go.com/gallery.htm. W1JSB used a Small Wonders Lab SW20+ and packaged it into a waterproof plastic box available at any WalMart with all sorts of extra goodies, batteries, speaker, audio amp, touch keyer, etc. Sort of a "sandwich style" approach. I would think you could take any of the ATS rigs and be very creative here.

Hey, Dale:

I don't have any one of those rigs you describe in the rules.

I have the original AT-Sprint, no suffix at all. In fact, I don't think there ever was a AT-Sprint version 1, the original AT-Sprint didn't have a suffix, there's not a suffix in the documentation.

But, I'll be glad to join the fray in July, on 40/30/20 meters, the three bands covered by the rig.

I wonder how many of the 50 or so "original AT-Sprints" can still be found. I bought mine a few years ago from a fellow who had bought it from the original builder. It wasn't in an Altoids Tin - I didn't know enough about the things to feel competent enough to dabble with it so I asked you to put it into a case. It still works quite well, thanks to your magic touch!

9088. Launchpad "heads up"

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-04 08:40:45 UTC
From: David
Topic: 9088 Message: 9088

Hi All,
just received my TI Launch Pad today to flash my MTR and I noticed the pins are different on the board I have than that which is shown in Steves notes. Steve's Launch Pad has TEST closest to the board edge followed by RST then RXD while mine (which is rev 1.5 vs. Steve's 1.4) has the VCC closest to the edge of the board. i.e. the VCC has been moved to the oposite end of J3.

So to cut to the chase, go by the printed values on your Launch Pad not just by the pictures in Steve's notes. You need signals Test, RST and GND.

Regards, Dave VK2DDJ

9090. ATS series (original, II, III, 3A, 3B, etc.) numbers?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-04 12:14:29 UTC
From: John Shadle
Topic: 9090 Message: 9090

I was just reading Hank and Dale's mention of the "50 original AT Sprint" radios and was wondering if anyone (Steve, maybe?) has a clue as to how many of each series exist. I'm curious.

Also, do we know how many different designs there were? I know of the original, the II, the III, the 3A, the 3B, the 4, and the 4 (second run--was it called the 4B?). Also, I feel like there may have been two versions or runs of the ATS-3B, also. Is there a history of these rigs anywhere?

I, too, picked up an original AT Sprint in unbuilt condition last summer, right before our move from NC to WI. I haven't had a chance to take solder to it yet, so it's still unbuilt. I didn't realize it was so rare.

Thanks.

Hi Gil, I went looking for our emails... and that isn't turning out real well, so.. unless something else turns up, how about this..The AT4b, in your hands, and working, would be $325. I'll keep looking for the other work, maybe I'll get lucky.And if it is better for you, you can make partial payments if you want?My paypal is daleputnam@... or you can sure send a check, if you want. Whatever is best for you.

There indeed was a second 3B, the 3B1.

I believe the intent for the QP is to honor each of the versions, but the easiest way to accomplish that is to list the models, not the verisons.Say you use a 3a ... that counts to those that need it as an ATS3... same for a 3b and a 3b.1 .. and the ATS4, that includes all versions and runs of theAT4. No need to complicate it.
But there is an interesting side note here too.. that is exactly how many of the Original Sprints exist? And where are they? How many were kitted? Then the rest of the family is begging the same honor on the tree. (family tree, that is)Does anyone have one of each?I'll be watching too, to see if anyone can get a Q with each one? Anyone up for a big MULTI-OP each position with a different member of the family?Don't forget there is interest in the other radios too.. bring them on, might be enough of them to makechanges in the mult lineup for next time... like the new TRI-BANDER.. or the PFR-3... both belong to Steve's family of design. A Saturday in July... this is going to be very much fun.

Hi Dale,

You were asking about the original Sprint.
I have my original first Sprint, that I built, plus some.

I would be real interested in total #s myself. I wonder how how many of the PFR-3's are out there? Mine gets thrown in the truck console quite a bit. I probably have more qrp field time with that one radio just from hunting and fishing trips. It is certainly not the smallest radio but with batteries, tuner and key on board it makes for a very convenient setup. I might just repackage my III into something like that. I run the audio into the truck stereo aux input and a hamstick on the truck and good for /m too. During the afternoon lull of dove hunting, it is nice to park under a shade tree and nap and play radio. Hoping for a MTR to MTR qso before the contest.

9098. Need HELP with ATS4 update reflash!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-04 19:28:58 UTC
From: mpupeza
Topic: 9098 Message: 9098

HELP!
I finally think I have the ATS4ND.s43 loaded into the IAR program after much futzing trying to load it. Steve's step-by-step doesn't work as I have no 'common' files and his references are to the ATS3B files. My ATS4 CD has only the .s43 file.
After getting my workspace configured with the blue comments and the black software instructions, I try to go to the debug routine with my cable plugged into the programming port, no power to the radio (I assume this as it's never mentioned), and the other to the parallel port.
DING! "The configuration does not have a debuggable output. (a debug-only project should have exactly one debuggable file as a root level project member.)"
That's what it tells me!
What is wrong?
Can someone walk me through the sequence from the point where I have the IAR program started on the screen?
Thanks

Okay, first you have to set up the options correctly.

1. On the tool bar, click "Project", then "Options"
2. In the pop up window, under "General" select the proper device, which for the ATS4 would be MSP430F1132A
3. Click on "Debugger: in the catogory list.
4. Make sure "FET debugger" is selected.
5. Click on FET debugger in the catogory list
6. In "Connection" select LPT-TI

Oh, power must be supplied to the rig, the parallel port does not supply power to the rig.

That should do it.

My 80/40/20 TRI-BANDER arrived in the mail today and I am quite excited about it. I am in the middle of building a couple of projects for this radio that will allow me to operate portable. As soon as they are finished, I hope to bring the TRI-BANDER to life.

It might not be an ATS family radio but it will be in the ATS sprint to hand out points, if nothing else.

Thanks to Steve and Hendricks Kits.

Steve;
No Go! Exactly the same error message!
Thanks though for the response.
I know the LPT port works as I had my printer working on it and the cable is definitely wired correctly. I had missed specifying the options previously so I thought that I had it.
My processor is a MSP430F1232 so I used that setting but still NADA!
Has anyone actually tried the software lately? The error message makes me think there's more than one program in the package!
If any successful 'reflashers' out there can help, please do!

There are, or could be, other settings in the bios for the parallel port. If you can get to them at bootup, see if you can change it from something that looks like SPP to ECP. I think you may need enhanced mode to do the programming.

John & Steve, and all;
Still no go! The BIOS of my Dell Latitude laptop shows the parallel port is set to ECP already.
I tried downloading a new evaluation copy of the IAR embedded workshop and it gave me the same error.
I tried loading the old .s43 file from my ATS4 CD and it also did the same, so, obviously, I am doing something wrong or have a hardware problem.
I've gone through my cable again, many times, even metering it out - it's good.
Does anyone know what the error message means?
Thanks,
Mike VE3EQP

Maybe you need to start from scratch. This the procedure for the lastest IAR version. Earlier ones use pretty much the same sets and settings.

File > NEW > Workspace (workspace clears)

Project > Create new project > click OK. --- enter a name for the project as the "save as" file name (ATS4something) > click Save

Right click on project name in "Files" window, in pop up, hover over "Add" then click "Add files" in pop up, select ATS4ND.s43 as the file to add and save.

The source file will now be loaded into the work space window.

Tool bar: Project > Options

General Options ----- Device >select MSP430F1232
Linker ----------Check "Override default program entry" ---check "defined by application"
Debugger ----------select "FET debugger"
FET Debugger --------select TI LPT

Everything should be now set up. You should be able to click the "assemble" icon in the tool bar and have no error messages. Then you can click on the "download and debug" icon and it should download.

At least it did for me, starting as a blank workspace.

Good luck!
Steve KD1JV

This is very interest and pleasant. I start my membership to the group with the ATS3b.1. It was my first surface mount complete radio kit. I never believe that a radio than small can perform as well as it does and after few years occasionally operating it, I still get very impress of how nice it works. It is not just a good performer, it is also a fatal attraction for others that never see HF radios like this. Some people doesn't believe it is a real HF multi band pocket size radio.

In one way or another all of them are gems, rare precious HF little radio gems.

Proud owner of ATS3b.1, ATS4, and MTR (more than radio) gems.

Best 73,
Milton A Riutort

9110. Hendricks Sota Tuner Change

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-05 05:26:17 UTC
From: KI6DS
Topic: 9110 Message: 9110

The manual for the Sota Tuner has been changed. We have changed the turns ration of the toroid from 28 turns total with a tap at 4 turns to 23 turns total with a tap at 3 turns. The reason? A half wave is a high impedance antenna with an impedance of about 3000 ohms. To match it, you need a transformer that will take 3000 ohms down to 50 ohms. I had a nice email exchange with Fred, and discovered that our turns ratio was not ideal, and could be improved.

I did some research and found the following.

For a transformer, the impedance Z(final) = N^2 Z (initial) where N is the turns ratio of the windings. With our original ratio of 28 to 4, we had a turns ratio of 7 (28/4). Plugging in the numbers gets the following:

Z(f) = 7^2 x 50
= 49 x 50
= 2450
Z(f) = 2450 ohms

This means that while our tuner would work, it was not optimum for a half wave antenna. Plugging in the new 23/3 ratio results in the following:

Z(f) = (23/3)^2 x 50
= (7.6667)^2 x 50
= 58.7778 x 50
Z(f) = 2939 ohms

which is a lot closer to the theoretical value of a half wave antenna which is about 3000 ohms. So, we have changed our manual to reflect that change.

Note that the impedance of an antenna depends on a lot of variables; height above ground, configuration, soil composition, and on and on. The easiest way to mod your tuner if already built is to take 4 turns off the tops of the coil and 1 turn off the bottom.

The manual for the Sota Tuner is online at www.qrpkits.com. Scroll down until you see the picture of the Sota Tuner. Click on it and it will take you to the Sota page. Then click on the manual to download. 72, Doug, KI6DS

The problem is almost certainly the fact that you are using a laptop. I had exactly the same problem with my Thinkpad, nothing I tried would work, when I switched to an old desktop PC with Win-XP it worked as advertised.

Fellow builders and friends,

I have picked up the SLT+, the TRI-BANDER, and a project box from Hendricks QRP. All 3 have, what I call, a burnished aluminum case, and quite good looking in my opinion.

How do you handle these cases to keep them looking good? All 3 of my cases will be used together as part of a "throw it in the backpack and go" to the field operation.

Would it be better to put Krylon "CLEAR" on the boxes before applying the decals and then a second coat of the CLEAR?

Or would it be better to apply the decals and just CLEAR coat everything?

Any opinions?

Jay

I generally scratch them with random scratches, so that any new
scratches aren't noticed.

Others will paint them with various colours - ask them how to make sure
paint adheres to polished aluminium. A good Model Aeroplayne or
Automobubble paint job usually takes a beating and keeps on ticking.

9114. Tri-bander painting

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-05 16:39:10 UTC
From: Roland Whitsitt
Topic: 9101 Message: 9114

I spayed a lite two brief pass on the pieces. Let dry. Then got the decals on. Let dry for hours. Then another coat of krylon clear matte. Dry. Another coat. My coats were too lite and one decal wanted to peal. I think it might have had a fold. I put two more lite coats. Oh well, at least no runs!
BTW, home depot and lowes don't carry krylon. Got it at walmart.
Almost done! Started to make silly mistakes so I stopped for now.
Tired but really excited!
Roland n5vwn
Thank you smd group for being tolerant of my 'thru-hole' project. Guess I'm not a purist.

Jay,
The SLT+ case is really nice, but I would have gladly paid more if it were silk screened instead of using decals.
I coated mine with Krylon clear satin to protect the decals, and was not happy with the result. The paint on top of the decal material has more gloss than the areas of bare aluminum - they turned "frosty", noticeably different from the decals. It is only noticeable at certain angles of light, but . . . not a perfect result. Too late - nothing I can do about it now. Using a clear gloss might work better.
If you want to experiment, I would recommend putting some of the spare decals on the inside of the case and test spraying over them - let it sit for a few days, and see what happens.
Good luck - let us know if you find something that works well.
If I had it to do over again, I think I would make my own cover art, laminate it in plastic, and attach it with spray adhesive of small screws. That is what I did with my MTR and I think it turned out very well. Then, if I want to change the cover look in the future, or it gets too scratched up to, it is easy to do.
73, Tom N0BS

Topic: 9098 Message: 9116

Steps forward but no Cigar - yet!

Terminology, or word choice is killing me. Steve says to hit the 'assemble' icon - nothing there. It's the build button. I loaded the .s43 file using the File - open, instead of the Project - add file because my .s43 didn't show up, until you change the drop-down to 'assembler files'. Whew, reminds me of a baking class when the instructor said to brush the loaf with an egg wash! Huh!
Anyhow - I've got the system ready to download finally. I get the "Initializing Hardware" then the Emulator says 'No device found or device disconnected'. I've tried this in both my Dell Latitude laptop and my IBM Thinkpad 600X both running XP, with identical results.
I'm assuming, now, that the resistor values may be wrong for these LPT ports. Any suggestions of what resistors to try instead, or of a interface change. I'm wired with the 5 -220 ohms to pins 1, 2, 3, 4, 16, with ground 18-25 and pin 12 of DB25 straight through.
I'm getting there but still need Help.
Thanks guys, I hope you're having better luck.

Mike VE3EQP - Surprisingly, one who has worked hardware and programmed stuff from 8080, 1802 Cosmac, 6502 Commodore, 6800 series, PDP8, PDP11, Interdata mod 50, 70, and more, and STILL has trouble!

A few coats of paint really helps with those decals. I will be interested to hear what you think about this rig once you get it on the air. Nice to have a tuning knob, but I have had the PFR 3 out so many times that I am used to Ats or pfr3 tuning these days. I have the discontinued dualbander and the knob is nice to use.

9119. MTR exercize

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-06 03:34:12 UTC
From: Tom
Topic: 9119 Message: 9119

Got my reflashed MTR back from Steve and finished off packaging it up. What a great night to really put it through its paces with all the contests going on at the same time (NEQP, INQP, 7QP, and ARI DX contest). 40m is wall to wall with strong signals, and the MTR performs marvelously under these conditions. Sensitivity along with great selectivity - what more could you ask for? I have to say I am really impressed how it handles the strong adjacent signals - really a joy to operate. I was able to S&P up and down the band and work almost everything I called, including 10 DX entities, best of which was 5,297 miles (VA to Ukraine) with 4w output to a dipole. Also, all 4 corners of the USA and many in between. Also used a 9v battery of questionable quality for a while and made a dozen stateside contacts at 1w out.
What a blast - NICE radio! Can't wait to get it out in the field now.
Thanks Steve,
Tom N0BS

I put a 220 ohm resistor in the line from DB25 pin 12 to the processor pin 28 - missing in drawing in manual, but described in the written explanation for the ATS3B.
I now get 'Failed to get target information'!
Did my previous wiring zap that pin 28? The ATS4 still runs but I haven't checked all functions. It appears to run OK in RX and TX and I can hear ticks when I run the update debugger, but no update.
I've now tried 3 different laptops in both parallel bi-directional and ECP modes. I have a buddy with a desktop that he'll get running and I'll give it one more try.
Unless that works, I'll hope for a new preprogrammed chip or live with the p for space PSK31 and the non-updating voltage readout (and any other glitches Steve fixed!).
Any other ideas welcomed.
Thanks

One key to successfully painting enclosures is to apply several thin layers, allowing drying in between them, and then bake in an oven at ~ 150F for ~2 hrs. This cures, hardens , and toughens the paint, making it much less succeptible to handling damage.

I love this radio stuff !

I've given up!
I've asked Steve to sell me a preprogrammed replacement chip!
Anyone trying to reflash that chip should be aware that there is supposed to be a 220 ohm resistor in ALL the leads except the ground.
The drawing in the manual doesn't show this! I 'may' have damaged the chip but it still seems to work so I'll button it up and run it though it's paces.
I wish better luck to others!

From: Jonathan
Topic: 9132 Message: 9132

I mentioned earlier that I used a different vendor for Kester EP256 this time--and although the fatter syringe seems like a better value, the blunt "needle" applicator tips are too large for the ATS rigs. At least that has been my experience.

Cash Olson provides a 23ga (.337mm ID) or 21ga (.514mm ID) applicator tip. CML includes 5-19ga (.686mm ID) "bonus tips" with their 19grams of solder paste. I noticed right away if 'flowed smoother' than I remember--but the fat stream is a problem with the smaller pads. I had better results by far with the smaller needle.

Only problem is you have to really squeeze the syringe (which broke my Cash Olson syringe) to get the paste to express. So I went back into my junk and found the Cash Olson tip, but can't find a thin enough component lead to clear a clog. That's a problem with having just one tip. I should have ordered a few when I ordered my first syringe from C.O.

So in the end, I'd prefer the thinner tip to less plunger resistance. Examining the bottom of the board after heating, it's obvious that I could be applying at least half less solder paste. My fillets bulge instead of giving me that nice convex meniscus. Can't say it enough--less is more with the solder paste.

I used a toothpick and it was easy to get too much... it definitely can cause problems.. not the least of is bridging between parallel parts which is a real pain to correct but by the second side I had it down cold.

Hi Mike,

Nice to see a familar call sign! I recall from the depths of my memory that I have worked you from a SOTA summit or two! I hope to have some more SOTA QSO's with you in the future using an MTR.

My MTR is S/N 131 - a sister!

I wonder how many MTR's ended up in the UK, I know of three so far - Pete G4ISJ, me M0CGH and yourself.

I haven't started building MTR S/N 131 as yet, I've just returned from a week's holiday in Northumberland, and I'm waiting for the replacement processor to arrive.

Colin,
I just PM'd you, but the gist was as follows.
Yes I have #55.
I haven't got round to building mine yet. I was away for a week in Northern
Ireland (with my ATS4. I wonder if that's the first time one of Steve's
rigs has been in action there?)

http://youtu.be/FFqKSDc_iaU

Since I got home I've been usefully employed on other jobs!

I did mange to get the Altoids tin ready so that's a start and about 25% of
the work done, and probably the hardest bit. Those tins are not easy to
work!

https://www.facebook.com/media/set/?set=a.3739352411308.2166497.1501105668&type=1&l=0caaab
8c27

I'm waiting for the updated processor and hope to make a start once it
arrives. I'd expect it will take 3 or 4 evenings to finish.

I'll be SOTAing with it as soon as it's working, although my ATS will
probably remain the rig of choice. We'll see. I'm still trying to decide

on bands, I'm thinking of 40 and 20 but 30 is a great band too. If only it was a tribander but then that's why I have the ATS4 :-).
Musn't tell the wife I've also just ordered an Elecraft KX3 for my Christmas present! It will be too precious to take up any hills, that will remain the domain of Steve's rigs.

Mike,
I was catching up on reading this group, and I just wanted to say that I updated the firmware successfully on my ATS4A. I just looked at the parallel port cable I made, and I did not have the resistor in the lead from the DB25 pin 12. I used the parallel port on my desktop.

One thing I noticed is that you said in an early message that you did not power on the ATS4. When I reprogrammed my ATS4A, I used the directions that Steve gave in:

http://groups.yahoo.com/group/AT_Sprint/message/7903

and he explicitly says to turn on the ATS4 when reprogramming it.

I had to do things a little differently since I had a different version of the software, but it eventually worked. Unfortunately, I didn't keep good notes, so I cannot say exactly what I did.

SUCCESS at last!
Steve answered me and is busier than a one armed paperhanger (His words).
He suggested that I check the voltages on the parallel port.
I scoped the pins and found that my cable, for the Dell Latitude, is the exact opposite of the diagram. I needed a 220 ohm resistor ONLY on the 5V line DB25 pin 12 to IC pin 28. The rest sat at 3.3V and pulsed low to ground.
I rewired the cable and it scooted through the reflash.
I haven't completely checked it out (it's after 11:00PM now) but the voltage reading is now following the input, which is a good sign.
However, if I paid myself $10 an hour for doing this, I could have bought several more new KD1JV kits!
Thanks to all the suggestions, both on the group, and private emails.
I'm pleased and will do a Happy Dance later.

From: Roland
Topic: 9144 Message: 9144

Just thought I'd mention briefly that I got the Weber Tri-Bander going last night. 1st two Q's were DX to Russia! I was in the same spot I made my first two Q's with the ATS3a, way back when. The first QSO's on that little rig were Alaska and Hawaii. My lucky spot! At work atop a 55' tank with a wire strung horizontally to another tank 150' away. About 130ish foot of wire. Grounded to the guard rail.I put the story on the other group for reading. Some typos as I was doing this on the iphone just after the event.
http://groups.yahoo.com/group/DualBander/
I think I'm going to have a lot of fun with these rigs! Further stories about this rig will probably be on the other site.

Unless you have a very very carefully controlled temp, the board will overheat to a temp that will affect the integrity of the board.

Ron,
There is, in fact, a YouTube video "out there" showing this exact thing - so it does work. Others have used thermostatically controlled toaster ovens to reflow solder paste as well.

Intellectually, I see a couple of issues:
- from the beginning of my soldering experience, I've been trained to minimize heat on semiconductors (especially)
- working 2 sided boards

Using a griddle or frying pan as the sole heat source one would have to raise the entire board up to the reflow point of about 360F - and not much higher. Careful watch on overall temperature would be required. A griddle thermostat cannot be trusted!

But perhaps more importantly, on a double sided board, you'd risk parts falling off the bottom while trying to solder the top.

When using a griddle just to preheat to say about 200F, then an embossing gun to reflow localized areas, the average board temperature would be less than 360F. The system is exposed to overall less thermal energy which to my thinking "feels better" in that you've attempted to minimize applied heat. Likely I'm over thinking this whole thing - but literally "frying" a solder pasted board just doesn't sound right - to me at least.

73,
Steve

OK after only one session I'm 90% through building my MTR.
Before I install the PA MOSFETS, is there any special way of mounting, and should we providing some sort of heatsink?
In the ATS4 they are in contact with the bottom of the case with a dab of heat sink compound. Do we need to provision something similar for the MTR?

TIA

9154. Another MTR working

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-09 21:05:38 UTC
From: paradoxpete.pdm@gmail.com
Topic: 9154 Message: 9154

I started my MTR this morning and I've just had my first 2 QSOs!
Both with Italy, first on 40 metres where I got a 599 and the second on 20 metres this time a 559. The only alignment I've done is to peak the recieve caps. I'll perform the rest tomorrow and box it up properly.
I'll then get it out on the hills and make it work hard!

http://flic.kr/p/bVjK6G

Outstanding rig and holds a lot of promise, I actually wonder if my ATS4 is performing properly as this little gem sounds a lot livelier!

Only problem I notice is that digits 3 and 5 do not display properly. The lowest horizontal bar does not light. All other digits eg 0,2,6 and 8 all display correctly so it's not the segment. Some bright spark will identify the problem immediately I expect?

http://youtu.be/wFmzqi_P0Cw

Thanks again Steve, you've done good!

Howdy pete:

Looks like a nice case you have for the MTR...did you make it or is it available commercially??

I think what you are seeing is the case for the ATS-4 in the upper background.

Sounds like that bottom segment is shorted to the bottom-left one (the difference between 5 & 6). Hope it's a solder splash or copper left on the board somewhere you can remove it!

Looking good Pete!

Your problem is a bit of a puzzler, hope a fix is forthcoming.

I started building MTR #131 today, I managed to get the DDS and processor chips on eventually! The DDS chip went on without much trouble, but I spent about 45 mins trying to get the processor nicely soldered! I discovered that the problem was the fact that the legs on the processor were higher than the underneath of the chip, possibly bent during programming or by the post 'crusher' machine they seem to use at the sorting offices these days!

I held the processor chip down on the desk with a finger whilst I gently pressed the legs down with the butt end of the tweezers, once I had done this the chip soldered quite nicely.

Anyhow the 28 pin beast is now out of the way and the now the other parts seem very easy to solder!

Hopefully I'll get quite a bit further with my build tomorrow.

I worked NG2D last night running 1.5W from an SW-20+ and a dipole, so I think the ATS event this Summer might be worth a shot with the MTR. 20m has seemed quite lively with US stations throughout the night of late.

From: Mike
Topic: 9128 Message: 9163

Hi guys,

MTR s/n 130 is up and running, boy was I pleased to see & hear that dit dit dar dar dar when after doing the pre test with ohmmeter, and applying 9 volts it came to life!!. I also had a slight problem with soldering of the processor pins, but with a little tweaking all was well.

Two qso's so far, an EM and an HB9 sota station.

I still have to paint and tidy the very recycled case but did manage to use up all the existing holes, so it seems to be coming together well.

With 9 volts it's producing around 3 watts and a little over 5 watts on 12.5 volts.

Rx seems very lively and was able to hear the C beacon on 7.039 on just the avo lead while testing.

The unused chip should be winging its way back across the Atlantic very soon, thanks again Steve for the super project and looking forward to getting MTR 130 on the hills soon.

9164. OT : Play with your LaunchPad

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-11 13:44:43 UTC
From: Yannick (XV4Y)
Topic: 9164 Message: 9164

Hi,

I ordered a TI Launchpad kit a few weeks ago so I will be able to update my MTR firmware.
The delivery has been fast and I have started to play with it waiting for the "real toy" to be released by the customs...

I already had a small experience with the Arduino platform.
Since I am under Mac OS X, a fork of Arduino called Energia is available for the LaunchPad/MSP430.
It is also available on Windows :
https://github.com/energia/Energia/downloads

I wanted to check how portable was the code from the Arduino to the MSP430 using Energia.

Here a result of a few hours of work :
http://xv4y.radioclub.asia/2012/05/11/balise-autonome-wspr-avec-msp430/
The timing is not accurate and some work has to be done for it to be really working on the air.
However, the good thing is that you can write code for the two platforms and/or reuse code written for the Arduino on the MSP430.

I know this is out of topic but since Steve use the MSP430 and many of us have expressed interest for the LaunchPad, I wanted to share my experience.

If you want more details, please send me a private e-mail.

73,
Yan.

9165. NAQCC Sprint Wednesday night!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-12 13:58:25 UTC
From: John D. Raycroft
Topic: 2848 Message: 9165

NAQCC Sprint Wednesday night!

Our May sprint is this coming Wednesday evening local time (May 16, EST - 8:30-10:30PM, CST - 7:30-9:30PM, MST - 6:30-8:30PM, PST - 5:30-7:30PM), which translates as Thursday May 17, 0030-0230Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201205.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX. A Certificate for top score in the GAIN antenna category. Finally there is one more award - a certificate to the highest score from a first-time participant.

Prizes: A prize of a set of bug/paddle handles or a K1/K2 knob insert donated by master woodworker Gregg WB8LZG is awarded for each sprint to the winner of a random drawing among all participants. Previous winners are not eligible.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6000+ members in: All 50 States - 9 VE Provinces - 90 Countries. Just sign up on the NAQCC website (http://naqcc.info/) and you will receive a handsome certificate, with your membership number which is good for life.

The April Sprint was our biggest and best one yet, with lots of activity - don't miss out on this one!

Come join us and have a real good time!

72/73 de Dave VA3RJ
NAQCC #0004

> When using a griddle just to preheat to say about 200F, then an embossing gun to reflow localized areas, the average board temperature would be less than 360F.

I'm a newbie to SMD soldering and appreciate the collective expertise in this group. Two questions if I may:

1. I see tutorials out there that only use a hot plate to gradually heat up the board and melt the paste, with no hot air used. It seems it goes slow enough to "condition" the paste (I forget the proper term). Is this a flawed approach compared to the 200deg warming + embossing gun method?

2. Would a heat gun (cheap "Drill Master" from Harbor Freight) on the low setting work instead of an embossing gun? Its air flow seems relatively light, at least compared to a hair dryer on low. Or is it still too much air flow? (I've never felt the flow out of an embossing gun)

Thanks & 72,
Barry N1EU

Last week I asked the wrong question about smd soldering.

Actually I bought a Madell 850B reflow station several years ago when it was a big fad! Never used it and now I want to build the new KD1JV radio.

Have no idea how to use it. Do I still need to pre-heat the board?

Anyone with this station have ideas on settings and useage? How far away should the tip be?

rOn

That is similar to many of the hot air rework stations in use today, and if you are only reworking a single component on a board no preheat is needed.Yet, if you are going to flow a board.. or most of a board, like doing an AT3 or 4... yes preheat in a cup warmer is much more elegant and much less stressful on the components.

the amount of air from a heat gun, can be measured with a feather... if the air flow is such that it blows the feather like a tree in a LIGHT breeze.. you'll likely be ok... but approach your work SLOWLY and have PATIENCE... or the result will be like using one that blows the feather like a tree in a medium to high wind. All the parts leave... or just some of the unmarked caps leave... IF you find them all.. placing them where they belong is diffucult at best. Another test of too much air would be... not very much more than you feel from your own mouth - wide open - with a full exhale.

I would be *extremely careful* of heat guns sold for paint removal, etc. They provide 3 - 4x the temperature needed and at an air velocity that would blow the parts off the board. I have a similar Black & Decker heat gun - which I would never use. It would blister a circuit board quickly only after scattering parts all over the room!

The embossing gun is a smaller inexpensive alternate to the "hot air re-work station". They cost less than $20 at the craft stores (JoAnn's, etc.), and often 40- 50% off coupons are available. Temperature is limited to about 650F (about 1/2 that of the paint removal tools) and have a very light air flow. Here's the one I have:

http://www.joann.com/darice-super-heat-tool-with-stand/prd20134/

Thanks for all the responses about the embossing gun. Clearly, my heat gun wouldn't be suitable.

I didn't get any responses to my first question on using only a hot plate in a single step process. Is the process shown in http://www.youtube.com/watch?v=Uov0SPHKcnk as good as the two step process in common use on this forum?

Tnx/72,

You could only do one side that way if you used that method. I would be real hesitant to try this because of the lack of precise heat control on hot plate type devices too.

9175. MTR - a few more little bugs...

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-14 01:19:15 UTC
From: Steven
Topic: 9175 Message: 9175

Okay,nothing too serious this time.

1. It is still possible to tune past the lower tuning limits and RIT limits, without warning.

I thought I fixed this, but turns out I only reduced the chance of it happening by 50%. If there is an odd mumber in the 100 Hz digit when fast tune mode starts, the lower limit won't get detected. Therefore, if your operating near the band edge, check the freq before transmitting or use single step tuning.

2. 80M band isn't detected. This is only an issue for a few and thier getting new chips.

3. If the rig is in Straight key mode and you do a setup save, it will remain in SK mode forever. Well, not quite forever, as you can clear it if you want. That is done by powering the rig up with the MENU button held closed. That will clear the options flags and the start up freq registers. Then do another set up save. Calibration data is not affected.

I was going to change that so the SK flag is always cleared on power up or before a setup save, but decided some might want to leave it that way, so it is now a feature.

For those who can re-flash thier processor, the latest source code is in the MTR/IAR folder.

Man, this better be the end of this!

For those trying to reflash their own chips using Steve's files,
I found it necessary to first open Steve's "MTR" workspace,
then "Project", "Options" "Debugger" and then select
"FET Debugger" instead of "Simulator" under "Driver".
If you don't do that, then "Download and Debug" apparently
happens within a software simulator with no errors reported,
and will never make it out over the USB port to the chip
on the MTR board.
I did not download his "Debug" directory tree, but did do a
"Project", "Rebuild All", before doing the "Download and Debug"
I found that IAR package amazingly confusing, don't be afraid
to ask questions (though I may not be around to answer them).

I have been trying unsuccessfully to reflash mine with the first update. I will give this a try, I had to put mine away for a bit or the Launchpad was going to live up to it's name and get launched HIHI.

I placed Steve's files at c:\msp\mtr two weeks ago,
vaguely remember a hard link in Steve's config to that.
But can't find it now, and I could be wrong.

Would be nice if somebody created a self extracting zip
file of all Steve's files, and then fully tested
and documented it.

That IAR stuff looks very capable for simulating and
setting breakpoints and monitoring registers and such.
But getting it to work the first time can be confusing.

Hi, Jerry.
Glad to see your MTR buid is coming along. I am wondering what the effects of the colored markers will be on the capacitors value, or leakage, etc...

I may have to do some experiments here myself to see if I can measure any differences when appling marking pen to the capacitors like this. (or did you use some form of paint?)

From: Steven
Topic: 9182 Message: 9182

It turns out you can't save the setup with Straight key enabled and then be able to disable it later! I cleared one of the flag registers when the rig is powered up with the menu button held closed, but not the one with the Straight key flag!

I just up loaded a new source code file which fixes that little snafu.

So, if you want to save the rig set up, first make sure your not in SK mode!

9184. 3 Digit Display Mod for MTR?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-14 21:41:37 UTC
From: wheeler2roh
Topic: 9184 Message: 9184

I'm one of the folks that will have to wait for the Steve's next MTR kit run (please do Steve!), but in the mean time I've been going over the specs and have enjoying hearing about early builder experiences.

Was wondering folks thoughts on upgrading the single digit display to 3 or 4 digits. 1st would involve MPS430 code changes (Steve has provided base Project files (I haven't yet worked out if the 430 could even drive a 3 digit display), and there would be some hardware mods. A "power save" timer could keep extra current drain at a minimum.

Thoughts?

Why limit yourself to 3 digits. Use a serial lcd display. Only need 2 lines from the original led display leaving plenty of extra for whatever.

It doesn't take long to get used to the single digit display as it is and it has the audio annunciator as well. I really don't even look anymore... hit the menu key and it spits it out in morse at you. I don't mind it being stripped down at all, that is part of the point of this rig and I think Steve did a great job of keeping the creeping features syndrome beat back here. It is a field rig and it fits in an altoids can and has just about everything I could want. An altoids compliant autotuner would be cool though...

Thanks all for the responses on adding digits

- LCD might be the way to go and open up more options, but I never like the look of them :)

- I'd forgotten that the MTR spits the freq out in CW as well, and good to hear this is quite workable. I'm sure Steve thought this through- I'm just an engineer at heart and can't leave things alone :)

- I've got a Norcal BTW tuner, but Steve's ALT tuner (Altoids can)
http://kd1jv.qrpradio.com/alt/ALT.HTM
might be a better match. Hendricks no longer kits this, but I might roll my own

Since the schematic shows pins 3 and 8 going directly to +3.3v, you can safely assume it is common anode. -Bruce, N1RX

Hi, Bill. The ATS-3 will not do 15M. The DDS chip/master oscillator does not run at a high enough frequency to allow this. The only way to convert an ATS-3 to a 3b is to first convetrt the AST-3 to dollars. Then convert the dollars into someone elses '3B.

Wouldn't it be possible to remove/replace those chips? Seems like much of the analog circuitry should be similar but I haven't compared the schematics. I doubt there's much of a market for a used ATS-3 or I'd do as you suggest. If the only option is to buy a ATS-3B, I'd probably go with an ATS-4 instead.

You could but you may also have to change other logic chips that aren't spec'd to the faster speeds. Plus you'd have to find a band board (nigh impossible) and change the firmware. Just changing the clock speed will make you go nuts in the firmware... let alone accounting for a new band. Not worth it in my book.

I'd be willing to bet you can get what you paid if not a little more for the ATS-3 and it would sell very fast.

AT-Sprint 3's of any ilk are still in high demand. You should be able to get your ca$h investment out of any AT-Sprint Model 3.x where x goes from nothing to 3b. There was an AT-Sprint model 2 for sale on e-Bay which I'd probably have purchased just to get one of them, but I'm saving my shekels for a KX3, once the dust has settled and the cacophony of "I MUST BE FIRST" buyers subsides.

The ATS-3 was originally about $165 give or take postage.

The 3A and the 3 differ. I'd have to look at the schematics to tell exactly. I believe the 3A did not allow the crystal filter to be bypassed.

Topic: 9195 Message: 9204

There was the ATS-3, 80,40,30,20 band boards. Also had a "wide" recieve mode that bypassed the crystal filter. Good for cross mode contacts or SWL listening. Kit originally sold for about $130, IIRC

The ATS-3a did away with the wide RX filter mode, and redesigned the band modules to improve performance, and had some changes to the T/R switching. from the 3a manual: "The new ATS-3A differs from the previous ATS-3 primarily by having an improved QSK T/R switching
scheme which eliminates or greatly reduces problems of IMD from strong SWBC stations on the 40 and 30 meter bands." I don't remember what I paid for the 3a, but it was similar to the ATS-3.

The ATS-3B, and 3B.1 was the rig that first included the 7-segment LED readout now seen on the MTR, and increased the DDS max freq to cover up to 15M. It covers 6 bands, 80-15M. I believe it sold for $170 originally. One unbuilt kit just was advertised for $200, and sold in less than a day.

The manuals for all these rigs are in the Files section of the group.

hope this helps,
Bruce, N1RX

Charles,

That is good to hear about Steve; I've never met him, but feel we all owe him a debt for providing such cool little QRP radio kits. Certainly, he is not getting rich off them and it is a labor of love instead.

Enjoy FDIM - wish I could be there. Let us know about anything really neat you learn about or see.

Folks,
I would like to know the maker/references of the connectors used on the band modules on ATS rigs. They are sip connectors on the motherboard and pin/pin strips on the modules with very thin round pins. Those are the ones broken in my rig, duh!
Thanks for your help.

Hi Jon, Which ATS radio is it? There were different SIP connectors used in the different radios. Is it the connectors on a single filter module.. or the jack on the radio?

Hi, Dale and the group,
it was from the original ATS. It was my first SMD kit and made at the time a bunch of no-nos. I have fixed all of them now, and have around 2.5 W with a 12V battery, so am a happy camper.
I have browsed the manuals on the files section of the group and have seen other versions used different pins/connectors.
A fellow colleague from EA5-land has sent me a good link from a Spanish dealer, so I do not need to track down the origin or maker.
Should you want to know what I was after, here it is a picture.

Hi Wayne.

This is what I did 4 and half years ago:
http://groups.yahoo.com/group/AT_Sprint/message/3871

It worked well, but I was not able to find an appropriate box for the ATS-3b + display combo and at the end I decided as Mike W1MT once commented, that the ATS-3b really wants to live in the Altoids tin.

Anyway, the display is cheap, the three shift registers as well and the software modification is not that difficult, I think it is still part of my alternate ATS-3b firmware, only switched off. The firmware has to flip the polarity of all display pins cca. 50x per second.

From: paradoxpete.pdm@gmail.com
Topic: 9213 Message: 9213

Well with some sunshine at last, I grabbed the MTR after work and headed for my local hill (G/CE-001).

Quickly set up with my normal EFHW feed with an Altoids L tuner, all hanging off an 8 metre roach pole.

A quick CQ SOTA brought a pile up of 22 chasers on 7Mhz, which I rattled off in 18 minutes.

Moving to 14Mhz the going was slower and after a quick burst of activity called it quits after only 8 Contacts.

A quick break and then back to 7Mhz to finish the day to bring the 40 metre total up to 35, 43 in total altogether.

13 countries worked, most reports varied between 59 and 539.

https://fbcdn-sphotos-a.akamaihd.net/hphotos-ak-ash4/389350_3976383256931_1501105668_3333058_1955340180_n.jpg

Very happy with the performance and the little rig will now live in the saddle bag of my bicycle. The ATS4 will come with me on hikes!

I've taken a bit of video which I'll post once I edit out the shots of grass and sky!

In the meantime here's what happens when your wandering around thinking everyone has played enough for one day!

I have three sprint rigs and when you get operating one of them
you will never even think about changing the display !
When you want to see and hear the frequency you hit one button and it displays the last three digits in sequential order and you hear it in your headset in moss code what could be any nicer then that !

Sorry to give you the bad news Steve but I have just reflashed my MTR with the latest code and now my 40m-20m rig thinks it is a 80m-20m rig! The download verified ok so it probably is a real bug.
Symptoms are:
1. When the lower band is selected, an 8 is displyed/anunciated.
2. When freq is queried it displys/anunciates 5600

I have not tried to tx to confirm DDS freq but believe it will probably be 3.560 kHz.

I'm trawling through the code with WinDiff tring to divine the statements relating to the band detection.

Regards, dave VK2DDJ

An update,
I checked the voltage on the CPU pin and it was fine, 40m gave me 2.2688V (just a smidgen high, should be 2.25V). Anyway the old code that worked tested the voltage against the value 0380h which worked for me (I don't have 80m, just 40m & 20m)and the new code uses 03A0h and above for 80m and 02A0h and above for 40m so after a quick flick through the manual for the CPU I found the ADC is 10 bit (ie 03FFh full scale) and it is set up in the code to use an internal 2.5V reference. So my 40m voltage of 2.2688V gives me 03A0h and the new code takes that as being 80m (jump to 80m setup if greater than or equal to 03A0h). Anyway since my MTR only has 20m & 40m I just uped the value to 03C0h and rebuilt the code, worked like a treat!
All the best, Dave VK2DDJ

9217. ATS 3b.1 on eBay

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-22 10:38:57 UTC
From: n1rx
Topic: 9217 Message: 9217

There's a built ATS-3b.1 on eBay right now.

http://www.ebay.com/itm/ATS-3B-1-QRP-POCKET-TRANSCEIVER-/290716384423?pt=LH_DefaultDomain_0&hash=item43b00bfca7

Not mine, but thought I'd point it out. It appears to be nicely made, with some really slick Altoids labelling done by the builder.

Hi Group,

Just received a ATS-4, 2010 vintage, in trade for a KX-1. No issues with the KX-1. Awesome, but pricey, package. But since I do nothing but trades I had little into it.

In any case I have this little jewel and will be firing it up tonight and learning the ends and outs of it. My long term goal is to play PSK31 and RTTY with peanut power in the field using a PDA or if I can get it to work, my old HTC phone that is running Windows 6.1 mobile. But first thing first... Not sure how many made. I get the feeling not many so reviews, unlike the KX-1, are far and few between. So any reviews from the group will be greatly appreciated. Next hints on using and getting around would be nice. Hidden features? Or just operating hints.

What I can see so far and the info sent is this. The radio is smaller and lighter the the KX-1 and has 80-15 up and running. The previous owner sent the radio to Dale-WC7S for a tune up and a mod. The TX is hot. 6 and 7 watts out and he wanted to make sure he was 5 or slightly less watts on all bands so a toggle switch was added. (a tiny one). The RX was tuned and according to the write up the radio is .15uv on all bands. WOW! Might give my K2 a run for it's money. In general the radio looks great....Now to fire it up and wait for any and all feedback on the radio, maybe using PSK/RTTY if anyone has. Bugs and funnies I need to look out for and just general information.

Thank you one and all

SN018, after a couple dozen pre-dawn, kids-sleeping, soldering sessions... has sputtered to life~! I fired it up with the old U10 in place and got a familiar "..._" blaring from my RatShack mini-amp. Sounds like I should solder Steve's replacement "two yellow dot" chip in, rather than trying to run the updater. ...for now.
Anyway, she lives! Thanks, Steve, for another awesome microscopic transceiver!

Dave,
I'd be willing to try rebuilding the code on my end too but will need some help setting the compiler up. Thats mainly why I did not go the reflash route. But since Steve will not be back for weeks I'll give it a try. I done this stuff before but may need a few tips from you if possible.....If we need to take this off line, contact me: bobc784gmail.com...TNX...

Anyway the old code that worked tested the voltage against the value 0380h which worked for me (I don't have 80m, just 40m & 20m)and the new code uses 03A0h and above for 80m and 02A0h and above for 40m so after a quick flick through the manual for the CPU I found the ADC is 10 bit (ie 03FFh full scale) and it is set up in the code to use an internal 2.5V reference. So my 40m voltage of 2.2688V gives me 03A0h and the new code takes that as being 80m (jump to 80m setup if greater than or equal to 03A0h). Anyway since my MTR only has 20m & 40m I just uped the value to 03C0h and rebuilt the code, worked like a treat!

50%. If there is an odd mumber in the 100 Hz digit when fast tune mode starts, the lower limit won't get detected. Therefore, if your operating near the band edge, check the freq before transmitting or use single step tuning.

Bob and others,

Seems like programming issues would be very ON-topic, at least as far as many our interest is concerned. I'd like to be privy to that conversation. Unless anyone objects, please conduct it **on** list if you please.
Jonathan KC7FYS

Might be easier for some to adjust resistor values
than to reflash the MSP430
Reflashing with IAR under MSWindows was fairly straightforward,
but read message 9176 first, and maybe 9179.
Let us know if you learn anything.
Jerry, KE7ER

Also, as stated in message 8950:
I downloaded the "code size limited" IAR software from
http://processors.wiki.ti.com/index.php/IAR_Embedded_Workbench_for_TI_MSP430
Just that compressed install file is 134 MBytes.

Topic: 9227 Message: 9227

Just would like to share my success with the group - my MTR s/n 131 fired up for it's initial power-on check without any problem. The sound of '4' in the headphones put a large smile on my face!

I messed up my first Altoids tin, the jack holes were too near to the PCB, I have another spare tin, so the metal work will commence again soon.

So glad to have the smoke test out of the way!

72

The Mity Box is shown here:

http://www.americanmorse.com/mitybox.htm

This was manufactured for the SWL Rockmite, but I was thinking of using it for the MTR.

I believe the Rockmite PCB is 2x2.5" and the MTR is 2x3"

Maybe the MTR would just fit with some rounding of the PCB corners? Looking at images with the Rockmite in the box, it seems there would just be enough room.

Would have to do something different with the antenna jack so close to the Toroids. Might also be an issue of the band switches going through the aluminum base far enough.

This would sure be a tough box for SOTA though!

Does this look workable?

9232. Re: A Mil Spec MTR Enclosure?

A better option would be the AA1, by the same machine company:

http://www.americanmorse.com/aa1.htm

It's a bit bigger, and would be a much better fit. You could possibly even fit a 2s Li-poly battey inside with the MTR. On both the MityBox and the AA1, you may have to replace the switches with slightly longer ones, or use a pen tip or similar tool to activate them. This is due to the increase wall thickness of the case.

Hi all,

just threw together a spreadsheet to see what happens as you relax the tolerance of the band select resistors. Anyway this leads me to believe the optimum hex values in the code to test for which band resistor is selected would be 03ECh for 80m, 030Ah for 40m and 0207h for 30m the 20m range is not tested as such, it is selected as the only remaining option once the others don't match.
Incidently, the original bug was caused by the code testing for 80m by looking for a number greater than or equal to 0400h, unfortuneatly the A/D maxed out at 0377h so could never satisfy that condition.

Bob, let me know what you find about the tuning rate.

Randy, my problem was that the resistor was 0.8% high in tolerance so if your resistor is closer or even low in value there will be no problem. The values given about are based on a "worst case" of 9.229% error on the 80/40 resistors. The other values were chosen the same way by opening up the tolerance, the 20/30m selection could handle a 23% error.

Jerry, yes perhaps changing resistor might be easier, until a pad comes away with the tip of the iron, like my mum used to say..it's a bit of fun until someone looses an eye! Once you get the reflashing setup working there is no way you would warm the iron as downloading is sooo much easier.

The problem I had with code in the files section:
1. file extesions channged to .txt and over wrote each other, dowload one at a time and fix the file extesion before dowload the next.
2. In the Project->Options->Debugger dialog box make sure the FET Debugger is selected, not the emulator. Also under the FET Debugger dialog box ensure the "Texas Instrument USB-IF" connection is selected. While you are in that dialog, check the "Verify download" in the "Download" tab, takes a little longer but is reassuring to know it was successful.
3. Don't forget to remove the IC from the DIP socket, you want to send the bits down the cable to the MTR not program the chip in the socket.

Regards, Dave VK2DDJ

If the resistor value needed to be trimmed downward to work properly, one option would be to add another high-value resistor across it to reduce it to the appropriate overall value. This would eliminate risk to the pads on the board.

Your modification of the firmware obviously works as well. You may just need to remember to mod the next version (if there ever is one).

Hi Bob, regarding the fast tune rate, I checked the code and it appears Steve has reduced the fast tune rate in the latest version from 200 down to 100. The normal rate is 50. Could this be what you are seeing?

Very nice! One problem.....taken from their website:

Will the Homestove be available for purchase? What is the estimated cost?
<http://biolitestove.com/campstove/support/#>

The HomeStove will be in large-scale pilot programs in India and Africa
through 2012. Our focus is on making it available for retail sale in the
developing world first. There are not currently plans to make it available
in the U.S.

From: Tim Goodrich
Topic: 9217 Message: 9242

Does anyone know where I can get the graphic file like the one that's posted on ebay? I'd like to print that and put it on mine.

Thanks,

Tim

I, too, looked at that with interest. It appeared to be printed on a piece of plastic similar to credit card plastic. Or is it simply laminated???

Fred - kt5x

Does anyone know where I can get the graphic file like the one that's posted on ebay? I'd like to print that and put it on mine.

Thanks,

Tim

Hi again,

Well here is the message I sent to WD8IOE (through eBay message server, because he's not on QRZ.COM and not found by Google) :

Hello,
Jake - ON4YZ here. I like the front panel of your ATS3b very much. Did you design it yourself? Is it avaible in a printable format somewhere. Would you mind to send me a file? The picture from eBay is copyable. I'll appriciate your help.
Very 73 de Jake - ON4YZ

And I got the answer through the same channel (eBay messages server) :

Hello Jake! The design is by kd1jv/Steve Weber. He can be contacted via the A.T.Sprint Yahoo Group. I hope that helps. TNX and 73.

- wd8ioe

It could be that the OM didn't understand my request, but that's all I can do with my poor English.

Would someone else try ?

Fred, I think it's laminated.

From: Bob Confrey
Topic: 9175 Message: 9255

Dave,
That could be...I have not had a chance to really give it a good
look. I typically like to move to the "slow" segment of the CW band
which is a bit away from the default freq.
I noticed that it would take forever to get there even holding the
tune up button for a prolonged time. You are way ahead of me in your
investigations.

On the reflash issue....I got IAR installed but Steve's instructions
did not work for me. I had to set up my own project. The code did
compile with no errors or warnings.
Since in this case the compiler really only needs to find the include
file, I guess it was happy. I'm going to connect the launch pad today
and see if I can reflash.
Once all that works, I'll want to know what to actually change in
Steve's code to fix the 80/40 switching problem....I'll add more later
today!....TNX for the help!.....Bob...EDJ.....

I created a new photo album containing images of the labels available in the Files section:

http://groups.yahoo.com/group/AT_Sprint/photos/album/744936926/pic/list

The photo names correspond to the folder_file names of the label files. It's a work in progress.

From: ve3wmb
Topic: 9231 Message: 9261

I have my ATS-3A in an American Morse AA1 enclosure and I have no issues with the switches.

I did however have to enlarge the holes for the paddle / power / headphone, as the jacks didn't protrude far enough due to the extra thickness of the box as compared to an altoids tin. (The plugs wouldn't go in far enough into the jacks without widening the holes in the side of the enclosure to fit the body of the plugs.)

One thing I do like about this enclosure is that I don't have to remove the thumb screws completely to change band modules, just loosen them up. One hole in the lid (bottom) is actually a slot so loosening up the screws allows the lid (bottom) to pivot out of the way (very handy). This is a quick enough procedure that with the MTR inside you could mount the band switches on the other side of the board and switch bands by opening the bottom of the AA1 to slide the switches instead of cutting two more holes in the enclosure.

Michael VE3WMB

P.S. If I recall correctly I also had to slightly bevel a couple of corners of the PCB to fit it into the box.

> It's a bit bigger, and would be a much better fit. You could possibly even fit a 2s Li-poly battey inside with the MTR. On both the MityBox and the AA1, you may have to replace the switches with slightly longer ones, or use a pen tip or similar tool to activate them. This is due to the increase wall thickness of the case.

Thanks for MTR - MTR. You were a big 599!
I've got you recorded which I'll post when I get a moment. In the heat of
the moment I didn't really pay much attention to the "also MTR" !
You were actually almost the first contact except G4SSH very significant
call was easier to pick out of the initial pile up!

Very interesting, especially since wd8ioe is clearly not his actual call sign. He obviously didn't build it, as then he would know the label was not provided by Steve.

Oh, well. I have always made my own labels. I sometimes print them on the white photo kitchen magnet sheets you can get at office supply houses like Staples. This lets you change the label at will. I have also used the same material to make a "stick-on" cheet sheet that stays inside the tin lid.

Nice going Mike and Pete! I look forward to having some SOTA QSO's with my MTR very much. It would be nice to work some other MTR's too.

I made further progress today. I made up the power lead and was able to do the intitial calibration. The best solution I could come up with, to calibrate the frequency, was to use a calibrated HP/Agilent Spectrum Analyser locked to an external 10MHz frequency reference. My MTR using this system showed an error of around +50 Hz with the default setting (close enough I reckon!).

The rx filter and BFO settings seemed quite easy to do using the oscilloscope, I noticed two peaks on the BFO trimmer, with one peak being a significant level higher.

As far as I know the rig is now nicely calibrated. I have yet to peak the bandpass filters, haven't thought about how to do it yet. I will probably hook up an antenna and do it by ear.

I'm very impressed with the documentation, somehow it is very detailed but also it's very concise - tells you exactly what you need to know without fuss - Well done Steven - everything about this kit and the support is first class.

Altoids tin is currently at 'work in progress' status!

So thrilled to be able to join in with the ATS/MTR fun!

From: Randy Moore
Topic: 9266 Message: 9266

Answered a 40m CQ from W4UOR in NC who gave me 579 and said the little MTR sounds great! I'm getting about 2w out at 8.5v supply and about 4w at 11v. Rcvr sounds great!

Board assembly went fine. I do better with and enjoy hand soldering, but had 3 cold joints - 2 on the microprocessor and the output of the audio amp, but they were easy to find and fix. As usual, the mechanical stuff with the Altoids box was more frustrating, and I hate that brittle Teflon-coated wire, which I ended up replacing.

This is my third KD1JV rig, and they all turned out great! Thanks Steve!!!! Hope your hike is going well!

73,
Randy, KS4L

Hi Bob, I have just uploaded a ZIP file which has the build files (looks like you have that sorted already so you need those) and revised source code (MTR_2.s43) which has my band switching values.

Good luck, Dave VK2DDJ

Not good enough. You get a "download complete" message
even if Launchpad is not connected through the USB port,
if you have IAR in simulator mode.
Verify that Program/Options/Debugger is set to
"FET Debugger" and not "Simulator".
Maybe someday I'll find time to read the IAR docs,
but for now this seems like pretty stupid behavior.

Maybe this has been reported before, but I believe the settings for User Preferences are reversed.

- Morse on/off is Tune Down
- Save current state is Tune Up

The manual, p. 21, has these reversed.

I am looking for one of the AT Sprint Series QRP trail radios. It must be fully functional.
I am mainly looking for the ATS-3B or ATS-4B but may consider other models.
If you have one for sale please send as much information about it as you can ,like mods, etc. Pictures would be great.
I can pay by immediate paypal or US postal money order if necessary.
Thanks
Tim

Ok, it appears that I've been successful in getting Dave's latest code into my MTR. After several attempts that did not appear successful, I finally used Dave's project files (which set the Debugger to FET per Jerry's advice) it did work. After pulling the MTR off the Launchpad and powering up, I was able to get both 40 and 80M band change with the switches.
I'll try this on an antenna tonight and see if it really receives.....Thanks for all the help guys.

BTW Dave, did you change any of the tuning rate values? You mentioned that it appears Steve dropped the rate from 200 to 100. I was happy with 200 since I move to slow parts of the band....While I'm at it maybe I want to reset my default start freq to my favorite areas? That should not be too hard?.....I'll get back with results of my tonight tests.....Bob....EDJ....

Bob,
Glad you got it to work.

This IAR Simulator Mode thing is sneakier than you might
think. I can download Steve's files fresh, sic IAR on
them, and have it start out in Simulator Mode.
I'll be going into Project/Options/Debugger to make sure
it's in FET Mode every time I mess with it.

From: philip_graitcer
Topic: 9274 Message: 9274

Completed #57 this afternoon and it fired up with no problems. Haven't been able to do the calibrations except by ear, but made my first QSO - K0LWV in MO, about 800 miles. He was 579, I received a 559. My antenna is a non resonant 80m horizontal loop.

I am using a 9V smoke detector battery that registers about 8.0 volts right now.

I'm only able to get 1.0 watts our on 20 or 40. Should I be concerned?

Thanks for the great build experience! Now for the hard part, putting it in an enclosure. Considering packaging it along with Stu's SOTA EFHW tuner.

Phil, W3HZZ

That's good news Bob!

I didn't change the tuning rates so let me know if you want them put back to the old rate. I'm not sure if the rate change was part of the band-edge fix or an unrelated change. You can set intial freqs with the preferences option but it should not be any problem to set them in the code for you, although I would probably email you direct with that change as it could lead to config management problems if I post it in the files section.

All the best, Dave VK2DDJ

Very good job..! The power is a little low, but I am sure that using a new battery may help you getting a better power output. If not, you always can adjust the finals PA toroid wire wounds to find the sweet point. The manual also mention something about this.

9278. Flashing The MTR With Launchpad (For Dummies)

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-24 23:51:06 UTC
From: Jonathan Haynes
Topic: 9278 Message: 9278

I've noticed various of us adding crucial steps and clarifications to the procedure outlined in the PDF. If possible, could these steps be neatly integrated into the following and reposted? (Use cut/paste to keep it organized.) I plan on flashing mine, but think we would all benefit from having more explicit and correct instructions available.
Jonathan KC7FYS

-EDIT PLEASE-
Using The TI Launchpad To Flash The MTR Processor:
Launch Pad Connections:

1. Remove the two jumpers connecting TEST and RESET pins on header pins between EMULATION and MSP-EXPANSION sides of the LaunchPad.

2.Make up some jumpers with about 6" lead length. You could tack solder wires to the shorting bar in the shorting plugs, be careful not to melt the plastic housing too much! You could also leave the jumpers in place and connect your cables to the expansion pads on the edge of the board.

3.The MTR board side will have the wires in Ground/Rest/Test order. These wires could be soldered directly to some SIP pins.

4.Plug the cable into the three holes directly above the 7 seg display and to the left of the crystal.

5.Remember, the sequence is ground, rest, test on the MTR board.

6.Before connecting the Launchpad and MTR board together, you should power each up separately.

Connect the Launchpad to the PC via the USB cable, then power up the MTR board, then connect them together.

Down load IAR workbench version 5.4 from http://www.ti.com/launchpadwiki
Install the software to your PC. Create a folder somewhere (My Documents is always a good place) and move the files MTR.eww and MTR_2.S42 into that folder. Start the IAR workbench IDE from your programs list.

File > OPEN > Projects
Click on "Projects"

Navigate to the folder you put the MTR files into. The MTR file should be highlighted and click the "OPEN" button.

The project will open and the screen will now look like the below.
If you have not done so yet, connect the Launchpad and MTR board together with the cable.

Hover the mouse over the icon with the green flag, second icon to the left on the tool bar. Download and Debug. Click the icon and downloading will begin. A few message windows will

open as it programs. It will take a few seconds before something happens in the "EMULATOR" window. Once the firmware is down loaded, the screen with change to the debug screen shown on the second screen shot below.
Since we're all done, click on the red X to stop the debugging and go back to the editor.

If you don't exit the debugger before removing power or the cable to the MTR, you will get error messages. No big deal, but should you want to down load again, the Launchpad probably froze up and you'll have to reset it by unplugging the USB cable an plugging it back in again.
That's all there is to it!

Found onther one...while looking into Bob's request to change the default startup frequencies I found the 30m upper limit was set to 10.250MHz, I guessing it should be 10.125MHz. Out of interest the current values are: (band)-(default)-(lower limit)-(upper limit)
20m - 14.060 - 14.000 - 14.150
30m - 10.118 - 10.100 - 10.250 (ie the bug)
40m - 7.030 - 7.000 - 7.150 (was 7.100 in previous version)
80m - 3.560 - 3.500 - 3.700

Regards, dave VK2DDJ

The UK has 10.100 to 10.150, other countries might have up to 10.250
so it might not be a bug.

Hi Colin, here in Australia and in the US it is also 10.1 to 10.15 so I'm pretty sure it is an error. Anyway I have updated the zip file containing the source code and project files that I put in the files->MTR section.
Regards, Dave VK2DDJ

9283. MRT Parts Help

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-25 05:15:36 UTC
From: jhg40earthlinknet
Topic: 9283 Message: 9283

Well, so far I manged to launch into orbit one reistor and one capacitor. Both took off while trying to remove them from the packaging.

Can someone tell me what size and wattage these things are so I can order the replacements. I don't know if the specifics matter but it was a 271 (270 ohm) reisistor and a 100pf cap (with the violet marking).

I've looked through the manual and through the messages here (and there are a lot of them) but have not seen anything helpful yet.

Thanks,
John

Dave,
I did give the MTR a listen last night and tune up. It switches
bands nicely now, thanks! However, I'm not pleased with the 80M
performance. Normally I can peak the input caps
on band noise. No so on the MTR (on 80M, 40M is ok). I will go
back and double check the input components. Because of how I had to
move things around for 80M, it is possible I got a wrong value in the
front end. I'm also going to compare the values for 80M from the
ATS-4B to the MTR....I'd think they'd be the same. My 4B works pretty
well on 80 but the MTR seems pretty deaf. I tried a sig gen on 80 for
tune up since I could not hear any signals and the peaking on the
front end caps was weak and broad. Not like 40M.

I did not realize you could set start freq in the preferences....Need
to read the manual...thanks! If thats the case I can just change
that, no need to spin the code for me.....
I'll let you know what else I find.....TNX!...Bob....EDJ....

On Thu, May 24, 2012 at 7:02 PM, David <djblunn@...> wrote:
> That's good news Bob!
>
> I didn't change the tuning rates so let me know if you want them put back to the old
rate. I'm not sure if the rate change was part of the band-edge fix or an unrelated change.
You can set intial freqs with the preferences option but it should not be any problem to
set them in the code for you, although I would probably email you direct with that change
as it could lead to config management problems if I post it in the files section.

The more of us who have the 4$ launchpad and can program, the better. The instructions will get refined that way. Also, having a programmable device with various firmware versions (as the ATS3B does also) you'd want to be able to apply tweaks at will.
Take the plunge and get the launchpad.

I have ordered a Launchpad but have no experience with one though. I originally asked for a new chip and Steve kindly posted me one via airmail, but as that was four weeks ago and it hasn't arrived, I must presume that the French postal system has had its way with the small envelope?? So, it seems that I will have to 'brave it' and have a go at reflashing the original one which I kept just in case this happened (French postal service from my experience is a little iffy at times and I didn't want to risk not having a chip at all with Steve's short time frames), and so I have begun building with the original chip.

I've read the document Steve posted that gives instructions and just waiting now whilst finishing the build to gain enough info from this knowledgeable group on exactly how to do it especially taking the revisions being mentioned on this thread into consideration. To this end, I particularly liked Jonathan's idea of a single list of instructions for 'this dummie' at least, so I can proceed when I get the build completed. I'll continue to follow this thread for such guidance. I'm optimistic that I'll manage and although never intended to reflash anything, am now quite keen on the challenge - probably famous last words!

Thanks to all who contribute here, it is very useful.

Andrew
F/M0ONZ

PS. Also a quick hello to you chaps in G-land - great jobs on your respective builds - hopefully we can MTR to MTR on 40m when I'm done.

Visually inspect the board, very very carefully, odds are there is a solder joint not right. Likely a ground around the paddle jack or the ic.Good luck.

Reflashing isn't that bad....but it helps to have a group like this to fall back on. I've had a little experience with compilers and still had to keep plugging away to get this one to work.
List suggestions helped. Using someone else's project file was what finally worked. Prior to that I was in the ditch trying things I "thought" were correct!.....We're here to help!....Bob...EDJ....

John,
I think the SMT R's and C's are 0805 size. I've used 0603 parts
to replace a few I messed up. They are a little smaller but fit the
footprint. I have lots of 0603 parts here at work. Not sure we use
any 0805's.....I can send you a few 0603's if you'd like.....just give
me your USPS info.....Bob....WA1EDJ.....Monroe, Ga.

9294. Re: Flashing The MTR With Launchpad (For Dummies)

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-25 19:18:44 UTC
From: jgaffke
Topic: 9278 Message: 9294

Here's my shot at rewriting the tutorial.
There's probably still bugs in this procedure, I'll try to test it
completely from scratch someday when I have access to everything again.
(I'm currently out in the boonie bushes.)
We need to specify how to obtain 3 appropriate header pins (use wire?).
I'm recommending we remove the MSP430 from the Launchpad, though an
alternative is to plug the RST and TST jumpers into the one pin nearest
the USB connector on the Launchpad rather than plug the jumper into both pins.
We need to finalize all those band edge issues and band select A2D values,
but that's just a matter of substituting a new MTR_2.s43 file.
I'm not sure that we can skip downloading Steve's settings subdirectory,
but that apparently worked for David Blunn so I'm following his lead.
Would be nice to package Steve's files into an executable zip archive,
avoids downloading lots of individual files as I do here,
and avoids installing the unzip tool which David's archive requires.
David's archive was built with a newer version of IAR than my April copy,
so I'd have to download the newest IAR to use his archive.
Not clear to me that we need to connect the boards after powering up,
if you do this I suggest you connecto ground first.
Some computers may refuse to talk to Launchpad over the USB port for
various reasons. You might try switching to a different USB port.
You might try leaving the straps as they originally were on the Launchpad
and talk to the MSP430 in the Launchpad socket to debug things
this far without having to worry about wiring up the MTR. We apparently
need to write a procedure to do this, as TI in their wisdom has not made
it an easy thing to do.

This is not as easy as you might think it should be, but easy enough.

##############
Using The TI Launchpad To Flash The MTR Processor:
Launch Pad Connections:

1. Downloaded the 134 MB "code size limited" IAR software from
http://processors.wiki.ti.com/index.php/IAR_Embedded_Workbench_for_TI_MSP430
This will only work on a Microsoft Windows computer with an operating system
from the last 10 years or so.

2. Copy the following from MTR/IAR in the group files section
to some new directory on your computer:
MTR.dep MTR.ewp MTR.eww MTR_2.s43
You can ignore the Steve's "settings" directory.
The file MTR_2.s43 will be changing as we come to a consensus on band edge
fixes and such, but Steve's file that's there now has the critical fix to
avoid transmitting monitor information.

3. Remove the socketed MSP430 from the Launchpad board so there is
only one MSP430 in the system. Launchpad can only be connected
to one MSP430 at a time.

4. Remover the black jumpers from the TEST, RST and RXD pin pairs
found on the Launchpad. Solder one end of three pieces of 6" 24 guage
insulated stranded wire (or whatever you have on hand) to the shorting
bars across each of those jumpers, you may want to cut away a bit of
black plastic first.

5. Solder the other end of those wires to a single wide strip of three
header pins of the same type soldered to the Launchpad for those jumpers
(or perhaps use pieces of ??? guage solid copper wire for pins, should fit
firmly into the holes on the MTR).

6. Plug the 3 header pins into the three holes on the MTR above the
seven segment display.

7. Power up both boards by plugging a battery into the MTR and running a
USB cable from a computer with IAR installed to the Launchpad.
This USB cable is included with the Launchpad. (Not clear to me
we need to do this before step 8, seems slightly more dangerous.)

8. Find the wire connected to the pin furthest from the cylindrical crystal
near the 7 segment display (if you look closely, you can see the pad is
connected to the ground plane of the MTR), and connect the jumper soldered
to the other end of that wire to two of the pins labeled "GND" in a corner
of the Launchpad. Then connect the jumper from the middle pin to the two
pins labeled "RST" on the Launchpad. Connect the jumper from the final pin
to the two pins labeled "TST" on the Launchpad.

9. Start up IAR Workbench on your computer.
Click through the menus for File/Open/Workspace, then navigate to the
folder where you installed the MTR files in step 2 and select the "MTR" file
with the mouse and then click "Open".

10. In IAR, click through the menus for Project/Rebuild_All, you should
see a message at the bottom stating 0 Errors and 0 Warnings when it's done.

11. In IAR, click through the menus for Project/Options, then select "Debugger"
from the menu on the left side of the screen. In the box to the right labeled
"Driver", it may say "Simulator", click the down arrow and select "FET Debugger"

12. In IAR, click through the menus for Project/Download_and_Debug.
If this eventually reports "Download Complete", then congratulations,
you have successfully programmed flash on your MTR!
Note that you will get a bogus "Download Complete" message if you do not
have the "FET Debugger" selected as spelled out in the previous step. (Gah!)

Hi Dale,
thanks for the suggestions.its hard to be really sure with those little tiny pins on two of the ic's(cpu and digital synthesis). not as simple as a poor ground on a jack, as i recall if i ground one line(forget which one) then pretty much nothing happens but if i ground the other it makes a noise and then resends the 4. so its not only not doing what its spozed to, its also doin something it shouldn't. i have looked at it really close, and sometinmes a bad connection can be deceivingly sublte so i may rewarm things and see if that helps, but i am wondering if maybe the cpu code got corrupted or the chip partially zapped.

First place to look is on an old board from a dead desktop computer, these pins are fairly common. Easy to remove if you take them one by one, and pull them with a needle nose pliers. Some may be difficult to get, if they are attached to an internal power or ground plane which would suck away the heat.

Another good source would be those four "LED" pins on the Launchpad, pull them out and solder in short wires to replace the jumpers.

If whatever you use is a bit loose in the three holes of the MTR, press them to one side so they make good contact.

> connect the jumper soldered to the other end of that wire to
> two of the pins labeled "GND" in a corner of the Launchpad.

Be sure to connect to the two pins labeled "GND", and not include the third adjacent pin labeled "VCC" in the corner of the board.

I don't know what these:
http://www.flickr.com/photos/jonathancharles/2897298586/
...pin sockets are called, but I picked up several strips of them at a shop in Akihabara years ago. They make great sockets for connections in the ATS rigs that you'd end up soldering and desoldering. They could easily be salvaged from PC carcasses, perhaps.

Jonathan,
They are called SIP (single inline pin) sockets. Those are the nice machined-pin ones, and good quality. For the programming port on the ATS series of rigs, there is no need to install one of these. I have found (like Steve) that simply placing the pins from the end of the programming cable into the thru-holes on the PC board, and applying some light side pressure by hand provides a very reliable programming connection.

9300. MTR annunciation

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-25 22:44:48 UTC
From: Skyridr
Topic: 9300 Message: 9300

Problem- no annuciation when the rig is powered on, although 2 or 4 shows up in the display. Also, there is no annunciation in the phones when the rig is keyed, or when the various switches are pressed.

Situation- Signals are received fine, so the earphones and jack are OK. Voltages appear OK for the audio amps, mixer, U9, and U6. The voltage for the drain of the keying transistor rises when a string of dashes are sent. 9 Volts.

What am I missing? LO frequency and BFO adjustment? I don't have a scope.

Suggestions?

Arthur;

That makes a little sense, only real problem being that the "WD" part of the callsign makes my radar go up - unless the Fox Charlie Charlie dropped the "N" for Novice a long time ago, too. There are simply too many people who use and abuse the Internet and email with fraud in mind, thus I give eBay sellers a long whiff before committing for a sale. Got burned five times, took money out of my bank account that was intended for a ham radio project! Have talked to wannabe hams who sounded very convincing, then the rigs they used were old CB doorstops.

My 2 cent's worth, is all.

Are you getting any sidetone at all? follow the audio path from the analogue switch back to the cpu and find out where it stops. Also check you have not turned annunciation off, I think powering up with the menu button pressed will reset defaults.

John,
I think the SMT R's and C's are 0805 size. I've used 0603 parts
to replace a few I messed up. They are a little smaller but fit the
footprint. I have lots of 0603 parts here at work. Not sure we use
any 0805's.....I can send you a few 0603's if you'd like.....just give
me your USPS info.....Bob....WA1EDJ.....Monroe, Ga.

Hi Jerry, I suppose that corrupted or zapped is possible. Although I've never had that happen.. have been convinced that was the case... right up until I found ... the worst was rosin UNDER the cpu. That didn't work well at all. The other time was a solder bridge that I found with high intensity light, and a lot of magnification. I'd hate to try to reprogram it when it may not be powering up right. Maybe rewarming will help. Good luck. Maybe something pops up ?

Hi Dale,

thanks for the suggestions.its hard to be really sure with those little tiny pins on two of the ic's(cpu and digital synthesis). not as simple as a poor ground on a jack, as i recall if i ground one line(forget which one) then pretty much nothing happens but if i ground the other it makes a noise and then resends the 4. so its not only not doing what its spozed to, its also doin something it shouldn't. i have looked at it really close, and sometinmes a bad connection can be deceivingly sublte so i may rewarm things and see if that helps, but i am wondering if maybe the cpu code got corrupted or the chip partially zapped.

Dave- no sidetone at all. Have gone to Preferences, and used switches up as well as down, in case the sidetone was toggled off. Also, did a menue press before/during power on to reset everything.

Thanks for your suggestions, will see what I can find in the audio path. Have reheated some of the connections.

I sent the unit to Steven for reflashing, seems that I was gettng audio before that, but am not sure. Wonder is something happened during reflashing. I ordered a launch pad today, maybe I can figure out something with it.

Hi Wendell,
if you have receive audio and the muting works for the QSK (ie no massive thuds when in tx) then use a CRO or multimeter (on AC) to find where the audio from the side tone is getting to. When I built mine I had sidetone but no rx af. Turned out to be one of the legs on the analogue switch not quite soldered to the board, the multimeter probe caused it to make contact. So could be o/c or s/c connection, as they usually are, fried components are not as common.

Hi Dale,
with very close inspection the soldering looked good, tried to reflash it but kept being 'not recognized', had set it up for 40 and 20 and it would give a four but not a two. even though it looked good i slathered the fine pins with solder and then wicked the bridges figuring got nothing to lose, might as well try it, i would not have believed it, all is as it should be.... reflashed and installed L-14. really really hard to believe.

If everything else looks to be working except the sidetone, it seems to me that the osc would be working. Is there anything out of pin 3 of U10? It might be that the sidetone line is shorted, so lifting R28 might help too. Do you have a scope or tone generator? subbing in a tiny bit of tone onto R28 would help tell where to look too.

Doubtful that the crystal is bad. The fact that the rig powers up and displays the appropriate number (2 or 4) means the MCU is running (using the crystal for it's clock).

You could try using your headphones as a signal tracer. Connect the "common" lead of the phones to ground, and use a clip lead to connect to the tip of the phones. Then using a clipped resistor lead or similar attached to the other end of the clip lead as a probe, see if you can detect the annunciation outputs from the sidetone line of the MCU (pin 3), or on that end of R28. I am not sure how much signal is there, but I would expect you to be able to hear something with a modern high efficiency headphone/earbud.

Could it be the option if you power it up with a 2 prong cord in the
key jack it will go to straight key mode?
try no plug in the jack or check the wiring to the jack for reversals

Hi,

The MSP430 has 3 clocks : one for the CPU, one for peripherals one for accessories.
I don't know Steve's design but the internal clock for the CPU could be working while the external xtal clock for the accessories not.

73,
Yan.

A good point, Yan. I have not studied the source code to know which clocks Steve may have used.

I believe he uses the square osc for freq generation and the 32768 osc for everything else. The mpu itself runs at it's own internal osc speed.

Dale- Am reading nothing at pin 3 of U10. Of course, pin 3 is for the sidetone, and should be showing 2.5V.
I have a Hendriks signal tracer/injector. A signal injected at R28 was audible all the way through to the phone jack, so probably there is no problem in that circuit.
I also have a tester for capacitance and inductance that can handle surface mount components.
How does U10 generate the sidetone?
Am I missing something simple? I use the menue to go to P, then toggle down, the P remains in the display until I hit the menue switch again.
Should the P go off by itself?
No sidetone in response to the keyer, either.
Am checking solder connections by using a 10X dissecting microscope.
I have a cheap DSO scope that needs to be upgraded to be useful.
Thanks to everyone who is responding.
Am hearing a lot of signals on 20 and 40.

Hi Wendall, Is everything else seemingly working? All except the sidetone... ///How about returning the rig to its default, by holding the menu button while powering up the radio.It may be that the radio got confused. Starting from default, might make it come around to letting you hear a sidetone.If there are other things that are acting up.. maybe starting from default will clear them too.I bet it will start working for you, pretty soon. Murphy will tire of it soon.

To be clear about the ats3b.1, it is well built, it was my fourth build, the sloppy part is the
external wiring for the audio amp, pots. etc. The tin case has some extra holes in it
and the lid is beat up. But the radio, encoder and tenna dipper are all well built and
working.
If anyone is interested you can contact me off list bgriffin at symbol
olp dot n e t.
I can also pull the radio and rotary encoder out of the enclosure and ship those alone
for $200.

When I did my rig it worked fine
then I mounted in a tin and because I had the sleve and center pin of the audio reversed on the jack it grounded out no side tone could this be your problem?

Hi Art,
Thanks for the suggestion, I do appreciate the effort and the input.
Solder joints that after very close inspection I was really pretty sure had to be good, must have been not quite good enough, or so it seems, because after reflowing them the problems are now gone. I suspect that in fumbling around while initially placing the chip I probably bent some of the pins up just a tiny bit, so with the chip laying "flat", most of the pins are in exactly the same plane and nicely soldered to the board underneath, but a few were ever so slightly bent up and floating just high enough that the sparse solder, while it had wetted the pins and pads, had not filled the gap. (Anyhow, kinda sounds like a good theory....)

9334. ATS rigs in the CQ WPX

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-28 02:48:22 UTC
From: camqrp@verizon.net
Topic: 9334 Message: 9334

Just putting the finishing touches on my MTR and the WPX contest started, so I dove in to see how it would play. Had a blast on 20 meters. The band was open and I managed to pick off several Europeans. This is not such an easy feat from my QTH which is hard against the foothills of the San Gabriel mountains, east of LA, with a 10,000 foot granite Faraday shield to the Northeast.

I QSYd to 40 meters and the big signals absolutely crunched the little MTR, providing me a graphic demonstration of what it's like to operate 40 from the middle of Europe. No problem, I switched to my ATS-3A which has an added RF attenuator in front of the receiver and I was again off to the races. Plenty of Qs available on this band and for reasons unknown, this rig has the best QSK of all my KD1JV rigs. A real pleasure to operate.

Sunday morning and 15 was alive, so I pulled out the ATS-4 and went to work on that band. Once again, lots of Qs and lots of fun.

OBTW, my power source for all these Qs was a battery pack made by taping together 3 used cell-phone batteries.

Don't need no stinkin' KX-3.

Cam N6GA

PS - But if one showed up on my doorstep, welll....

9337. MTR: Flexing Altoids detunes MTR

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-28 15:31:21 UTC
From: wrmoore47
Topic: 9337 Message: 9337

My MTR is working fine, but I accidentally discovered that if I put a little pressure on the Altoids tin near the upper band toggle switch, signals drop way down to almost nothing. Releasing the pressure returns things to normal. I've checked to make sure the switch enclosure is grounded. What else could be causing this???

From: n1rx
Topic: 9337 Message: 9338

Most likely a marginal solder connection. Another possibility is a hairline crack in a capacitor.

It is unlikely that you are actually "detuning" the rig. The DDS chip does not shift frequency like an analog VFO might. It sounds more like a loss of signal in the receive chain, as you slightly flex the board, Hence, my theory of a marginal connection somewhere...

9340. [TRI-BANDER] Decals and Finished

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-05-28 23:58:29 UTC
From: Jay
Topic: 9101 Message: 9340

Fellow KD1JV enthusiasts,

I finished my tri-bander this evening and all works great. It was tested against my K2 and I am very happy with the results. My WM2 shows 5 watts on 80m, about 4.5 watts on 40m, and 4 watts on 20m. The tri-bander signal sounds great on my K2 with no chirps and no raspiness. This is going to be a fun radio for the fox hunts. I got the 80m, 40m, and 20m bands for my radio.

Tom N0BS, I have to agree with you. I would pay extra for a silk screened case as opposed to using decals. After getting the decals mounted and somewhat straight, I sprayed 2 light coats of Krylon satin clear on the case. The edges of the decal are still visible. Decals work, but they still look like decals on the finished product.

I have a Brother PT2100 label printer that I used to produce labels for my project case (from Hendricks QRP Kits) to support the tri-bander. This case includes fused power, reverse voltage protection, NESCAF filter, and a voltage readout. All total, 10 labels with black text on clear backing were produced for the case. When the smoke clears, this method was easier than decals as the labels just peel off the backing and stick where I put them. The case was prepped with 2 thin layers of satin Krylon clear, labels applied, and 2 more thin layers of satin Krylon clear applied. While the edges of the labels can still be seen, my main effort was to produce custom labels for this project and I am pleased with the results.

I look forward to getting the tri-bander on the air.

Vy 73 to all

Jay
AJ4AY
Mobile, AL

Jay,
The SLT+ case is really nice, but I would have gladly paid more if it were silk screened instead of using decals.
I coated mine with Krylon clear satin to protect the decals, and was not happy with the result. The paint on top of the decal material has more gloss than the areas of bare aluminum - they turned "frosty", noticeably different from the decals. It is only noticeable at certain angles of light, but . . . not a perfect result. Too late - nothing I can do about it now. Using a clear gloss might work better.
If you want to experiment, I would recommend putting some of the spare decals on the inside of the case and test spraying over them - let it sit for a few days, and see what happens.
Good luck - let us know if you find something that works well.
If I had it to do over again, I think I would make my own cover art, laminate it

in plastic, and attach it with spray adhesive of small screws. That is what I did with my MTR and I think it turned out very well. Then, if I want to change the cover look in the future, or it gets too scratched up to, it is easy to do.
73, Tom N0BS

Has anyone had experience using the QRP KITS SLT+ with random lengths of wire in the field (preferably with a sprint family transceiver)? I know KD1JV is the designer but wonder what the occasional field operator thinks of it? I am thinking of getting one to use with my MTR in VT on vacation this July.

No experience at this time. It is on my lost of home brew, got to try it, projects. However here is a link to a QST Short Take review. My personal feeling is that is should work very good. One version I saw, and have a copy of a write up put away safe...aaaahhh, has it built in a Altoids mint box using the small jumpers used in computers instead of toggle switches. In any case it works on the same basic design idea as a LDG ATU. But you are the computer.... Hope this helped

I traded a KX-1 for it. Reason? I nuts! Well sort of. He had contacted me about something else and one thing led to another and the ATS came up. I was not familiar with it so did some reasearch. One more band, a bit more power, about 1/3 smaller but most of all being able to do PSK and RTTY with a radio much smaller then a FT-817 or my K2. Furman expressed interest and fasincation in the KX1 and in the end he got it and I got the ATS and a few $$$ to offset the difference (his choice and offer not mine...a real gentleman).

Impression so far. Great design. Hears as good if not better then the KX1. Quiet, sensitive and seems to be extremely selective. Kind of miss the adjustable filter the KX1 had, but not that much.

Next trick getting portable digital up. Got the software loaded in my ACER-ONE with xp and in my old HTC Ozone phone running Window 6.1. Did not have time to do my with the ACER and found that the HTC loaded and runs , but it does NOT have a touch screen and I can not get the cursor to move left/right so can not tune. So as it is now garage sale time or ebay to find a cheap PDA running windows. Wish the software had a left and right option other then the display.

So that's the short form of the story.

Hi Dale,

Thanks for the info. Just a FYI. It appears you know the radio I have. Does the name Furman and the call sign W4MJT and a power mod sound familiar?

Hi Harry,
  The main difference between the no version and the later versions is moving the "on" switch to the top panel. That puts 5 buttons on top in the later versions.

I just got a ATS4 and the owner said it was not a A or B model. Checking the lastest manual on line with the one that came with is does not indicate and major differences. Any comments would be greatly appreciated. One other thing. Has anyone tired PSK31 or RTTY with the radio. If so any comments on that also. Thank you

There is an application, that simulates a mouse cursor with the arrow keys and Ondra OK1CDJ experimented with it.

http://blog.ok1cdj.com/2008/06/jak-lpe-ovldat-pocket-digi-na.html

Ondra is using following application to drive the mouse simulator. There is a demo version, full version is not free.

Dave,
Been off for the Memorial Day holiday here in the US.....I did find that 80M upper band edge is set to 3.700. Hard stop tuning with a single beep.
I did reset the default start freq to my preferences....no need to change that. I had not read far enough in the manual to see that one.
The only real issues are with the band edges being reset. If you come out with new code that would be nice. I can live with the tuning rate being
slower.....80M is still deaf....Still looking into that. So far all component values look ok, at least for the leaded caps. I have to check any SMT caps in the front end...

Dave,
The SLT+ is nominally designed to be an EFHW wire tuner. I'm not sure how broadband it is for "random length" wires as you asked about. Why use a random length? The tuner works quite well with half wave wires, which will also work on the harmonically related bands. I use one with my MTR. Good luck and enjoy your vacation hamming in VT!

I have the early version of the ALT that uses the "headers" rather than switches and it works fine. I would suggest that you look at the eHam reviews as I recall reading some feedback that the current model with switches (i.e SLT +) adds a lot of additional stray capacitance which impacts the matching ability of this tuner.

The BLT is a much more versatile tuner as it will match balanced lines as well as end fed wires and likely even an EFHW. Speaking of which if your MTR is 40m/20m why not go with a EFHW tuner (i.e the SOTA tuner) and a EFHW for 40m.
The 40m EFHW should also tune (in theory) as an End-Fed full wave on 20m.

Tom,
Thanks for your input. No reason for random wires, just that for some locations they are all you can easily put up. Just want to keep my options open. I used to use an L-Tuner with a length of miniductor in series with the line and a 140 mFd variable capacitor at the output end of the miniductor to ground. The coil was taped with a flying lead and clip and it would match almost anything. The circuit was the same as the SLT+ only with more L flexibility. It also was a lot heavier and bulky in size. Used to use it with an ARC-5 receiver and 6V6 transmitter for portable operation. Now that was heavy QRP.

I tried to use a Paddlette BP-K1 with my ATS II, but I think the rig had trouble identifying it as a paddle. It only sends dah dits with either lever. I noticed that the base wiring contains small capacitors and suspect them to be the problem. Anyone else have an idea about this before I just clip out the capacitors?

9365. Re: [AT_Sprint] ATS II and Paddlette BP-K1

From: Steven Carr
Topic: 9364 Message: 9365

if you're sure they are capacitors then they are probably there for debounce purposes, but shouldn't be of any benefit for most rigs and were it me I would clip them. they may be MOVs or similar for transient suppression (i.e. ESD) purposes, in which case I would keep them as long as they didn't ohm out as shorted.

verify the wiring with an ohm meter...small capacitors from the dit and dah keys to ground shouldn't affect keying at slower speeds. also ohm out with a lever pressed to make sure the adjustments (if any) aren't so tight that closing one lever pushes the center post into the other lever.

I exclusively use an L tuner (by KD1JV) for all my portable work.

It works bes with half wave length wires, but my 40m antenna also tunes on 30, 20 and 15 metres! I add about 3 feet for 17 metres.

Here's my MTR and Altoids L tuner on it's first field outing, including a MTR - MTR contact!

Adam,

My old paddelette BK-P1 get dirty very easy and need attention on this. But this just make one of the circuit (dih or dah) fail, not do what you mention about sending the same (dah) which each side of the paddle. Mine has the cables attached direct to the paddle screws, nothing in between, nothing that I have seen before. Never remove the bottom magnetic pad of it, so don't know what is inside.

I only can suggest to start dividing the problem into parts to find what's wrong. Check again the solder points on main processor (U10) pins 9 and 10 and keep going all the way to the paddle connector.

Good luck,

Milton A Riutort

I'm building a II now, but my memory seems that this is a situation where the radio doesn't see the paddle, during power up.It then assumes everything to be a straight key. Mine does that every once in a while when I power it up and have the paddle shorted.

I've been saving this clear plastic case that an Apple mouse came in. There is room in the bottom for a battery, although the setup is larger than an Altoids tin,

After final calibration and testing I was able to get almost 5 watts on 40 and 4.3 watts on 20 at 12volts input.

Worked 6 countries with it during WPX. Now it's time to try in the field!

Although I meant to build it using solder paste, I left it in my home refrigerator when I went to my beach retreat to build it! Soldered by hand, one piece at a time.

Hi Bob,
sure no problem to change the band edge of 80m by why don't you have a crack at it yourself? The two lines you want to change are on line 604 & 605 of the source 9see below)

```
int80: mov #0000h,&fbcd_l ;low bits of start up freq in binary
mov #0356h,&fbcd_h ;high bits of start up freq
int80a: mov #03c00h,r14
mov #0003h,r10
mov #0370h,&fh_limit_h ;high tuning limit <---- This one
mov #0000h,&fh_limit_l <---- & this one
mov #0350h,&fl_limit_h ;low tuning limit
mov #0000h,&fl_limit_l
mov #03c00h,r14
mov #0002h,r10
```

The band edges are 32 bit values that are stored in two 16 bit words called fh_limit_h for the high limit high order part and fh_limit_l for the lower order part (the lower edge uses fl_limit_h & fl_limit_l). Best of all the numbers are BCD so its dead easy to read, 0370h is 3.570 MHz and 0000h is lower part down to the Hz. So if you wanted to set the upper limit to 3895.2 kHz it would look like this

```
mov #0389h,&fh_limit_h ;high tuning limit <---- This one
mov #05200h,&fh_limit_l <---- & this one
```

Note that I put a extra leading zero in the second line, I'm not sure if that is really required but it helps the assembler recognise that it is a number not a variable name.

Once you make the change just save, rebuild and download as before.

God luck sorting out the deaf rx, must be a wrong componet value or something like that.

All the best, Dave

You can set intial freqs with the preferences option but it should not be any problem to
set them in the code for you, although I would probably email you direct with that change
as it could lead to config management problems if I post it in the files section.

Dale:

I am very sorry for my confusion on this. Apologize me.

I am sure that the newest version can be change to straight key mode while turning on and holding close one of the key paddle. May be also on this ATS II version, but something is causing a short on both paddle because the dih dah transmit sequence.

Hard to help with a correct solution, but just try to close the circuit with another thing different than the paddelette to see if it is causing the problem.

Steve design not just pull to ground each circuit, take a look into MTR schematic diagram and you can see what I mean.

Hope this help better,
Milton

Thanks Steve for the insight. I am not one of those hot CW people, but I am getting into it more and more. I don't have $$$ anymore being a displaced EE with almost 40 yrs experience. (Turn 55 and no on wants you) so I am now pushing drugs at Walmart making about 1/4 th what I use to. So my radio hobby started out with a few older radios that were seeds for trading and i have had a ball doing it. During the trades, I have had too many to list, I had in my hot little hands a K1-4, HB-1A and recently a KX-1. Comparing them to my ATS-4, that I traded the KX-1 for, I would say at worst it is as good as the K1 and KX1, but really not. It appears better. And as far as the HB-1A their is no comparison, far better. I still have not had time to compare it to my K2. Coming soon....But for now I am off and running learning the radio and getting PSK31 and RTTY up and running. I have a AXIM 30 on the way and that should do a fine job with PocketDigi. I have a
Acer-One Netbook that has the PC version in, but have had no time to try. And I own a NUE-PSK modem. So this should be a fun summer.

I am very impressed with your designs. If you ever go serious I think Elecraft might be a little nervous as far as compition to the KX-1 and K1 family. KX-3 Nope. Way different animal.

Thank you for your great designs and if you have any suggestion for me I would love to hear them.

If you are talking about mine (MTR #57), my apple mouse was packaged in it.

There is also a very neat clear case that the iTouch comes in. It is about the size of an iPhone and perhaps 2.5 cm thick.

Don't know where these could be purchased without the electronic gear, however.

From: Skyridr
Topic: 9378 Message: 9378

I have posted some photos of the enclosure that was constructed for the MTR. I wanted something more robust than the standard altoids tin.

Clam shell construction was used. The top was fabricated from aluminum sheeting sold for door kick panels. The bottom piece is aluminum extrusion that is sold for electronic boxes, maybe these now are available from Digikey or Mouser. The extrusion box is about 4.25 x 2.5 x 1.5 inches. Only half, or one part is used.

The template provided in the assembly manual didn't have the correct dimensions when printed on my computer. I made a new template by using a heavy clear piece of plastic. Pins or small brads were first used to mark and hold the plastic over the 4 corner pcb standoffs. Then, a location of the various openings for switches were marked. Holes were cut and the template was checked to determine that it fit the pcb.

The template was then taped to the aluminum top of the cover, and holes were drilled or punched. I used a hand punch for most of the holes. Labels were printed and taped in place, and modified for satisfactory fit.

Labels were printed on water slip decals. Assembly was painted, labels were applied, and final coats of clear paint were applied.

I am pleased with the results. Questions? Let me know.

MTR 131 is finally completed and trail ready.

I worked a handful of stations last night during the IARU 1 Field Day contest - I was hoping for some nice QSO's, but in the end 20 metres was full of contest stations, so if you can't beat 'em, join 'em!

The MTR receiver seemed to cope very well with all the strong signals on the band.

I'm very impressed with my first taste of an ATS rig!

I'm totally blown away by the MTR, it's amazing!

9384. Sleepless night/ Smoked MTR

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-06-03 14:50:18 UTC
From: jhg40earthlinknet
Topic: 9384 Message: 9384

I spent a sleepless night last night thinking I was the first to smoke their new MTR.

No shorts found, powered it up, nice hiss in the headphones, no display. Then came a horrendous pulsating sound in the headphones. Powered the rig down. R26 appeared to have blown. A round hot spot appeared to be on the MCU. Rechecked everything, powered up again (probably not smart) and same results. Major bummer.

This morning I again look for problems and then remember something stupid I had done. When I installed S7, it was not flush with the PCB. I tried to remove it to reinstall it and pulled on of the solder lugs out. What did I do? Of course, I stuffed it back in and installed the switch.

Now I decided to try the switches. S7 was stuck but I unstuck it and now MTR comes to life with band annunciated, band displayed, voltages good, Dits and Dahs audible in head phones. WHAT A RELIEF.

Now to order a new R26 and slide switch. Maybe Field Day will happen after all!

9385. ATS4 Firmware Flash

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-06-04 00:22:25 UTC
From: bob_nelson_k2qpn
Topic: 9385 Message: 9385

I am trying to flash the firmware in a ATS4 (original). No luck. I made a cable per the documentation. Ohmed it out several times - seems OK. I attach the cable and power on the ATS4. If I use workbench and open ATS4ND.prj and then AST4ND.s43, the debug icon is grayed out. If I open the ats4edit.eww file, I can start debug. Debug then complies the code but fails "Can't find device".

Any ideas?

Something else I noticed. When I power on the ATS4 without the flash cable, I can hear receiver noise. As soon as I connect the flash cabel to the ATS4 and the PC, the receiver noise stops. The noise resumes if I unplug the cable.

Bob:
Look back through the archives for my posts of a few weeks ago.
My resultant success was when I measured the voltages coming from the parallel port in the idle condition. I then put a resistor in the one lead that was 5V and removed (strapped out) the ones that were at 3.3V. My cable looked like the opposite of the drawing.
After that, the software jumped into action, gave me a progress bar and loaded fine.
Ignore the change in noise levels when the cable is connected. Whatever it is doing is not relevant to the flash process.
Good luck.

Ge Bob
I had a similar problem with the cable I built. Mine problem turned out to be that the picture I was looking at to build the cable from was a mirror image of the one I had built.
Bottom line is, if I says it can;t find the device, it most likely is a cable issue.
Take a look and yours and see if this helps, it worked for me!

I have seen many great looking Sprint and MTR rigs in the photos section. Many have digital pictures of local high spots, etc. What is the technique folks are using?. Are they printed onto a glossy laminate material or are they printed onto an adhesive label? Whatever the technique, where do you get the material from? My MTR works great but looks a bit shabby and can use a makeover. I finished it with several coats of Heath kit green then applied rub on dry lettering and some clear Krylon. It is definitely old school and looks it. How do I dress it up?

Dave,
I used the following process.
Stole a nice image of my local mountain off the InterNet.
Overlaid the text I wanted on the image using Microsoft Publisher (or similar).
Sized the printout to fit the Altoids tin and printed it out on a color laser printer. (Print several in case you mess one up)
Cut the corners to conform to the shape of the tin. Make sure you leave enough room for the mounting screws to go through the image to hold it on the tin.
Laminate the printed image using a 3M self laminating product #LS854G which is full page size and glossy. You can first cut pieces out of the page to laminate smaller objects, or there are also smaller sizes of this same product available (4" X 6", 5" X 7", wallet size - apparently used for photographs a lot). One page costs less than $2 and will do many Altoids sized printouts. I found this laminating product at the local printing shop. You may want to also use this to laminate other operating aids (MTR menu, tuner settings, etc.)
Then I printed out Steve's artwork to locate the holes properly, and overlaid that.
The push button holes I punched with a single hole punch (paper punch) which works because they are close to the edge and give a perfect hole.
The rectangular holes I carved out (very slowly and carefully) with a new, sharp exacto knife. It works best to cut through one layer of this "sandwich" at a time in order to prevent having to use too much pressure, which can lead to slips and ruining the art work (or worse).
I used a small drill bit, hand held, to drill the mounting holes at the corners.
Clean up any rough edges with the exacto knife and mount the finished art work to the tin.
I didn't even bother using any other adhesive to hold it in place in case I wanted to change it later. The four mounting screws hold it flat and in place nicely with no buckling.

A Dremel tool may also work well for making the various holes, but you would need to keep the tool speed low enough so as not to melt the plastic laminate.

It sounds a lot more difficult in print than it is in reality.
I'm sure there are many other approaches to accomplish this as well. I was quite pleased with the result, and it's not permanent. You can see mine in the photos section.
Good luck - show us your finished product when you are done!

I have three reels of SMDs that I don't need. Anybody who wants to pay postage can have them.
Email me off-list, please.

These three reels of SMD resistors are as follows:

--5000 pcs 1/8watt 4.7k
--5000 pcs 1/8 watt 6.8k
---1000 pcs 1/10watt 1.5k

From: ea2bd
Topic: 9396 Message: 9396

Hi,

with the recent move to the new wonder ATS-4 & MTR, I am interested in buying a used ATS-3. I'd like a good condition & fully functional rig with 20m & 40m components.

I have a friend in USA so CONUS transport would be Ok. I can pay by Paypal.

It's a pity I can't manage with surface mount nor have enough time to build it by myself so I prefer a used rig.

I look forward to hear your offers. Take care 73

From: mpupeza
Topic: 9385 Message: 9406

Bob,
Leave the cable as you now have it set!
You are doing something wrong in the software setup. I wish I knew more about it but I just kept trying various ways and was able to, finally, get it to fly.
Go through the posts that I sent, and received, and it may come to you. I do know that there were MORE parameters to set than the original instructions. The debug icon pops alive when the software is ready for the flash. Suddenly, it'll work. As I recall, I used ONLY the .s43 file, then told it to 'build' then it 'compiled' with no errors and it was ready to flash.
I doubt that you can do it wrong if it gets that far as to flash.
Good luck.

9409. ATS 3A - low power output - help

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-06-08 09:29:03 UTC
From: richardk4krw
Topic: 9409 Message: 9409

I have an ATS 3A that has low output power. I'd like to get it working properly.

When I built it I did not have a QRP watt meter. So, I didn't realize how bad it was. I built a WM-2 and now I can see I clearly have a problem.

Here is the output power on all bands with a 9V power supply.

20m 0.5W
30m .9W
40m .9W
80m 0.08W

While I don't have much for test equipment (VOM - analog & digital, watt meter, my other transceiver), I do have friends with other equipment if needed.

Any suggestions on where I should start looking?

Thanks,

Richard

Hi Richard, A little more information would be very helpful. It is also very very good that you are using a 9v supply too. That will allow a little more freedom to tune it, without stressing the finals. That power level indicates that all the connections are in good condition. The adjustment that can be done is the squeezing or spreading of the turns of the toroids on the filter board, L2 and L1. Before adjusting them, an extra recount of the turns would be in order. The current drawn during tx could be monitored and recorded. It shouldn't go any over 900ma. With 9 volts expect to see something around500ma

Some interest in the chassis mount bnc connector that I use on the Altoids and other mounts for the AT series radios. These are very nice in that they mount with very little real estate used inside the box, and they allow the lid to close correctly, if the hole is cut critically.If there is interest, I will stock these for folks. Please let me know of your interest, no need to order now, just let me know, k?

Hi Dale,

Pricey little devils, but I hate having to bother with adapters, so, could you send me 2 of them? So, tell me how you are able to close the Altoids top with that BNC and other connectors?

I'll send it to the PayPal address you recently provided to someone. My address:

Steve Russell, N7SR
5617 133rd Street Court
Apple Valley, MN 55124

If you think the MTR might be ready to go out in a week or so, just include them in that package. Thanks.

72,

Steve, N7SR

they price out at $12.

Indeed, a very nice example of workmanship on Katsu's MTR. The Fujiyama illustration on the case is a nice Japan mountain touch. I wonder what the fist pump to MTR weight ratio is for Katsu's set-up?

9421. Help with ATS 4B

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-06-09 11:10:20 UTC
From: db66jy
Topic: 9421 Message: 9421

Hi
I finally managed to finish my ATS 4B. It seemed to be working great but the frequency on 20 meters jumped to 65 Mhz. (Maybe when I tried to turn on the split function?) This happened a couple of times when I was testing and aligning it but then went back to 14 Mhz and it seemed to be working fine Now that its tucked into the case it jumped to back 65 Mhz with a loud tone in the headphones All of the other bands seem to behave correctly.

Any ideas where I should hunt for the problem? I had a few solder joints that needed help earlier so I suspect there is another one somewhere.

Hi Steve

I am not sure if you can puchase it locally in your country. The box I used is TAKATCHI SW-95. Below is the link to the vendor's site.

http://www.takachi-enclosure.com/

SW series boxes can be found in this brochure.

http://www.takachi-enclosure.com/data/pdf/en2011_025.pdf

SW-95 is about 2 USD here in Tokyo.

Just for your info., this is what I used to prepare the box.

9423. NAQCC Sprint Tuesday night!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-06-09 13:57:50 UTC
From: John D Raycroft
Topic: 2905 Message: 9423

NAQCC Sprint Tuesday night!

Our June sprint is this coming Tuesday evening local time (May 16, EST - 8:30-10:30PM, CST - 7:30-9:30PM, MST - 6:30-8:30PM, PST - 5:30-7:30PM), which translates as Wednesday June 13, 0030-0230Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201206.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX. A Certificate for top score in the GAIN antenna category. Finally there is one more award - a certificate to the highest score from a first-time participant.

Prizes: A prize of a set of bug/paddle handles or a K1/K2 knob insert donated by master woodworker Gregg WB8LZG is awarded for each sprint to the winner of a random drawing among all participants. Previous winners are not eligible.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6000+ members in: All 50 States - 9 VE Provinces - 90 Countries. Just sign up on the NAQCC website (http://naqcc.info/) and you will receive a handsome certificate, with your membership number which is good for life.

Added Note: The NAQCC European Chapter Sprint will also take place Wednesday, June 13, 1800-2000 UTC. Full information on their website at: naqcc-eu.org/

Come join us and have a real good time!

72/73 de Dave VA3RJ
NAQCC #0004

Hi Dan, Seems you and Murphy have a good relationship going here. I just hate when he comes around here. It might pay to inspect with a 30X glass, all the joints or connections around U7 and U10. Close inspection, for me, is faster than reheating,and safer for the plastic too. I can make the button tops look really weird with a hot soldering iron.Good hunting,

Hello All

Pleased to report that S/N026 came to life this evening. The LED shows the number 4 for a short while on power up which I think is correct, and through some ipod earbuds I can hear it send the number four, but its quite faint. Is that how it should be? I wasn't sure if it should be louder or not? Still to do the other tests and calibration, but I'll leave those until the morning.

Relieved for now

Finally got around to opening up the MTR again to look for this problem and had to chuckle when I did. I had failed to clip the underside of the wire from the PC board up to the antenna connector! It was clearing the Altoids box by about 0.1mm. So any pressure on the box in that area shorted the antenna to the box! Now I'm totally happy with my little MTR!

Check out my pix in the Photos folder "MTR KS4L".

Andrew- I assume you are writing about an MTR (since you gave a s/n...) The sidetone from the MCU (including the band announcement, should be fairly loud. Check the connections between the sidetone output of the MCU (U10 pin 3) and the audio output stage.

Thanks Bruce. Yes, it's an MTR. Some kind advice from the group suggested I try different earphones which I did. This was helpful and did help to some extent when I changed to a pair with 102dB and 16 ohms. On receiving your post though, I looked again with the magnifying visor, but this time I just stared at pin 3 on U10. It eventually became clear that a minuscule spike of solder from the rear edge of the foot of pin 4 (GND I think it is) was or might be touching pin 3. I was amazed at how difficult this was to find - I literally had to stare at it for a while to see it! It has 'done the trick'. The band annunciation volume is much improved, it probably more than doubled, and I think its sounds right now, thank you.

Other tests and calibrations have gone well and I am now enjoying this wonderful little radio.

Thank again to Steve and the group!

All the best
Andrew

From: Larry Makoski
Topic: 9433 Message: 9433

Happy Father's Day to all the Dads out there!

Father's Day night happens to be the June 2012 edition of the Run For The Bacon. That friendly lil' ol' QRP Sprint sponsored by your friends at the Flying Pigs QRP Amateur Radio Club International. Join us for a spell to have some fun and to say "Hi" to friends, old and new.

The time is the same as always:

East coast - 9:00 to 11:00 PM local time
Midwest - 8:00 to 10:00 PM local time
Rockies - 7:00 to 9:00 PM local time
West coast - 6:00 to 8:00 PM local time

The rules are at:

http://fpqrp.org/pigrun/

9434. MTR - 80 M receive problem

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-06-20 16:26:04 UTC
From: Steven Weber
Topic: 9434 Message: 9434

Those few who built the MTR with the 80M band may have noticed poor sensitivity on receive. It seems I over estimated the amount of capacitance needed to pad the trimmer caps. Replace the supplied 47 pfd with 22 pfd caps and you will be able to peak the input and get proper sensitivity.

Sorry it took so long to investigate this and find the answer..
Steve KD1JV

9436. ATS3B at KB5JO/VE3

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-06-20 20:02:47 UTC
From: russellhulett
Topic: 9436 Message: 9436

Used the ATS3B again from grid EO31om, Poirier Lake, Ontario (http://www.loonhaunt.com/poirier/) May 26 to June 9, 20M only.
There is a picture of the station under photos in the KB5JO folder. Used an EFHW tuner and 34' wire in a tree, no counterpoise, just like last year, 3W most of the time power from 8 worn AA cells.

The band seemed in poorer shape than last year, but still made more than 50 QSOs with folks all over the US & Canada. Unfortunately, no ATS/ATS QSOs. The longest path was to AK, about 2200 miles. No record, but still impressive.

The little radio continues to impress me every time I use it.

Apologies for the bragging...

73, Curt KB5JO (/VE3)

9437. MTR blessed event for number 0103

Morning gang,
Yesterday I got the first contact with my newly built MTR. It was with Jack, W5WQQ also a qrp op. I got a 539 despite the qsb on the signal.
I was so happily surprised since I had to replace the CPU chip that Steve was kind to send out to us. It is a great little radio. I am using an end fed half wave ant with a homebrew SOTA tuner based on the Hendrick's model. What great fun.Special thanks to Steve for the great little radio and Dale for his support.

72,

Barry, ai2h

Well done Barry, enjoy.
You've just reminded me that I have a processor waiting in an envelope to
post back to Steve, whoops!

I also run mine with an EFHW, it's been great so far.
My first outing with #55 here -

9444. FOX hunt and FD report

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-06-24 23:14:30 UTC
From: Dale Putnam
Topic: 9444 Message: 9444

Ok.. FD report.. with just a little over an hour to spend, I worked only 20 meters. And logged 25 states.... not bad for an hours worth of work, with the new Fox chaser... Tri-Bander, and a 100 foot doublet, at 20 foot. I had a lot of fun, and it was good to be able to tune across 20 and find signals, over most of the band. For those that worked me... you were in Qso with a 9v solar charged battery powered station. Yep.. qrp.. ain't it a kick? And now.. the TB is rarin' to go get a FOX!! And that is going to happen, right soon too. Get ready! Thursday is the big day... the next sound you hear... will be the TB... being locked and loaded!! I'm so ready.. can you tell? My goal for the TB is to WAS with it on 20 this year. SO.. get ready.. here we go... Here foxii.. Here FOXii... Here FOXII>> HERE FOXII>... (is it workin yet?) See you Thursday evening... or Friday morning.. if you have a GMT clock.

Enjoyed reading you report. So guess I'll add mine too.
Used my two tri-banders for fieldday. In the backyard because just spent 5 days traveling and enjoying disneyland. So already a bit worn. Solar charged motorcycle battery. Pop-up 6' x 6' x 6' screened awning, although for the 1st time in a decade, the temps were in the 70's and not the usual 106! Casually managed 35 qso's which is a good haul for me, even with a hundred watts.. Very impressed with 80 meters. Worked 25 sections. Antenna was 71' wire over a 60' tree, so a sloppy inverted 'L' with a UNUM and 35.5' counter poise. I was prepared to switch to a 100 watt icom706 but never felt the need. My code is about 17wpm so I had to listen a couple few times for stations sending faster. I usually stay up all night, but this time was happy to end at 1am local time. About 12 hours on and off operating.

9446. ATS4B Build

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-06-25 06:14:13 UTC
From: andrew.cross
Topic: 9446 Message: 9446

Hello,

I am as far as page 16 of the assembly only manual in the build of my ATS4B - Toroid Coils!

I am confused with the wording of the paragraph below from that page which explains the details on the toroid coils and their locations. If I simply ignore this written part and simply go on the table (also copied in below) I think that I know what to do, ie it makes sense in terms of how my board is labelled - it is labelled with L11 through to L20 and appears to be logically oriented left to right on the board for the toroid locations. Its the written paragraph that seems at odds with the board and table? For example, 'note the difference in number of turns for L18 and L17 depending if you are building for 17 or 15 meters - it seems to me that 17/15 are at locations L19 and L20?

Please could someone help me by confirming which way is correct here, do I just follow the table? I am probably missing the obvious or perhaps my board had revisions to the labelling or something? As I say, probably me :)

I'm sorry to be hassle, but I have re-read it several times and just cannot grasp any certainty from it, certainty I would like as I progress slowly and steadily with what has been a really enjoyable build!

Many thanks in advance.
Andrew

QUOTED SECTION - From pg16 of the ATS4B Assembly manual under the heading, Toroid Coils!

Note that the L15 and L16 labels were duplicated for the 17/15 meter
locations and obviously should have been labeled L17 and L18. Also note the difference in number of turns for L18 and L17 depending if
your building for 17 or 15 meters. Besides the resistor value used in band select, this is the only difference between these two bands. Install
the coils as you wind them so that they don't get mixed up.

80 Meters L11, T30-2 (Red), 23 turns (12□") L12, Red, 26 turns (13")
40 Meters L13, T30-2 (Red), 16 turns (8□") L14, Red, 19 turns (10□")
30 Meters L15, T30-2 (Red) 12 turns (7□") L16, Red, 14 turns (7")
20 Meters L17, Yellow, 11 turns (6□") L18, T30-6 (Yellow), 16 turns (7.5")
17 Meters L19, Yellow, 12 turns (6□") L20, T30-6 (Yellow), 14 turns (7.5□")
15 Meters L19, Yellow, 10 turns (6□") L20, T30-6 (Yellow), 12 turns (6□")

L26 .
wind ten (10) turns on black FT37-43 core and install flat to board.

Wind coils with wire evenly spaced around core.

Sorry, That is an artifact from the original ATS-4 board. The numbering was corrected on the board for the A and B versions, but for some reason the note in the manual never got deleted as the manual was revised for the later models.

So yes, ignor the text and go by the table.

Hi Gang,

I'll be getting on a train and heading for Glacier National Park early tomorrow morning. If all goes as planned, I will be gone for two months and hike about 900 miles along the Continental Divide Trail. I sure hope I'm ready for this, or it could be a much shorter trip, hi.

I will NOT have a rig with me. There is just too much stuff I have to have and the pack it getting a bit heavy (and full) as it is. Also, I'll be traveling with a group, but mainly, I think I'll be too tired at the end of the day to play radio. Most days all I'll want to do is eat and go to sleep.

I'll try not to fall off a cliff or get eaten by a Grizzly bear! See ya in the Fall!

That's kind of like asking if somebody prefers Ford or Chevy.

To me, 40/20 are the money bands. If one isn't open, the other usually is. If they are both closed due to bad conditions, then you aren't likely to find my action anywhere on HF.

But then, I like Fords.

My vote is for 30/20 and then maybe a second rig on 40/20. My preference for 30/20 is based upon my backpacking needs. 1) Shorter antenna wires, this less weight. 2) If you are out during a contest weekend, 30 gives you some reprieve from crowded conditions.

Steven-

Just keep an eye out for bears. Blacks will run away if you shout at them, but don't challenge a grizzly. If you have time, drop your pack, they might stop and munch on it and give you a bit more time.

Still snow on the peaks near here. Streams are high and fast due to snow melt. Flies are starting to come out. Warm weather hit us only a few days ago.

Water might look good for drinking, but giardia is common, but spores can be filtered out.

Be careful if you need to climb over deadfalls because wet logs, heavy pack, and fatigue all are factors that can result in a fall that can easily break a leg.

If you need help and somehow can call 911, they need to know how badly you are hurt, your lat/longitude, and color of your tent. Helicopters will come, but be aware that they are expensive.

I am headed to Washington state for a ride on the Snake River tomorrow, will be out of town camping and exploring frequently.

Have a safe trip, a lot of us will want to hear about your adventures.

9462. ATS-3B kit dated Sep 10 2007

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-06-26 03:21:15 UTC
From: wa2ohf
Topic: 9462 Message: 9462

I have been trying to figure out why this ATS-3B is dead.
I have an ats3b1 to compare to and there are a few differences on the board itself and the document I'm using to build it seems to be the correct one dated February 15th 2008
The kit date I think is sep 10th 2007

Looking On the actual board u8 pins 5,6,7 are all connected and there are traces over to U7 pins 11 and 12

This is not what the circuit diagram shows page 29 MPU/DDS TX REV 1 9/15/07 fixed CMP DES

On it, it shows U7 Pins 11 and 12 Ground and pin 16 connected to U8 pins 2,3,5,6

I'm trying to trouble shoot why the rig is locked with the wrong voltages on u7 pins 14 through 20 and correct voltages pins 1 through 13 ?

I have looked with a 30 power for solder bridges and all look ok .
Is there a place I can download the assembly manual for the 2007 printed circuit board that I have to match the circuit print to assist in troubleshooting?

Anyone have any suggestions Thanks
Arthur

Hi Art,
I believe I have that one in my data file, will have to find it in the morning. In the meantime, it may pay to look at the regulated voltages of 3.5 and 5, and if they are good, lift one end of L7, then apply power again, check for audio, and display. Let me know, K?
Have a great day,
Dale - WC7S

The Summer Season of Fox Hunts starts tomorrow night, and the two Fine Foxii have made their announcements, and it is with pure anticipation of a lot of fun,I am sure. Anticipation only makes the reward that much sweeter. We finally got here, to the start. Best wishes to each of the Foxii, for a great run, tomorrow evening. They are two very good ops, and the band props princess promises to be good to us. It is a great day for a FOX Hunt!!

From: camqrp@verizon.net
Topic: 9466 Message: 9466

Friday night before Field Day at the Zuni Loop, the antennas are up and we have some time to play radio. Keith W6SIY and I have connected the MTR to a 20 meter dipole, up about 40 feet in the pines. This is our north/south antenna so it looks down the hill, out over the Mojave Desert about 3000 feet below us. A nice perch for chasing over-the-pole DX.

After a few stateside Qs I make contact with OH1VR, Seppo, who is booming in from Finland. We decide he must be one of the long-lost Marx brothers. He gives me an RST of 589.

I'm running the MTR powered by a bundle of three used cell phone batteries. Seppo describes his station as "1500 watts to stacked yagis". Keith says I should tell him I'm running 4 watts with stacked cell phone batteries.

There sure is a lot of fun packed into this little MTR!

Wow I can't believe those words came from Steve's mouth! Any ATS, earbuds, SOTA tuner, a little wire and a 1200 mAh LiPO should be well under a pound total and not take much room.

I would find a way just for safety on a 900 mile hike in wilderness.

obviously you don't do much backpacking! ;-) when all those ounces add up
you have to leave stuff behind that you'd prefer not to.

regarding safety, something like a Spot beacon would have less weight and
less bulk.

I've been portable operator since I started in the hobby in the 1970's.

While the electronics has really shrunk in size the battery capacity is still an issue.

Steve can use the Li-Po battery but how will be recharge it? The longest hike I've been on lasted a week. I could make do with a single charged battery.

For all practical purposes I would not depend on an HF CW QRP rig for primary emergency communications. You're at the mercy of the propagation and would have to spend time rigging a decent antenna. Some CW operators are comfortable receiving basic QSO information such a the callsign and RST but may not correctly copy a detailed QTH or emergency message.

I'd take along a cell phone and one of these portable emergency position indicating radiobeacons for safety.

You don't...for emergency use only. In the recent Field Day I made ~30 QSOs with an ATS-3 which consumed 138 mAh according to my charger. I'd expect a 1200 mAh LiPO stored at 50% to have plenty of power after even a couple of months storage at typical mountain temperatures (typical loss at a 40% storage charge is 4% assuming 25C for 1 year...even better at cooler mountain temps).

Geez...what a sad commentary on ham radio. Some of us actually still know how to exist without cellphones and GPS (which others in Steve's group may have anyway). When (not if) the systems behind these fail, our radios will still work. Some CW operators might fit your description, but >99% would be OK and available to take over for the other 1%.

Regarding the battery comment Mike:
My sympathies are with Steve, every ounce is a serious judgement call. I carry the radio for the enjoyment factor, but as noted, it could be a lifesaver.
I used six disposable Lithium AA batteries on the AT and only had to replace them once, they last forever. This is using an ATS-3A of course, your mileage may vary. I made a really nifty carrying case for them by using an Altoids tin. You can see the photo at:
http://groups.yahoo.com/group/QRPme_Kits/photos/album/342018751/pic/list
<http://groups.yahoo.com/group/QRPme_Kits/photos/album/342018751/pic/lis\
t>
(Hopefully the link displays correctly, if not you can see them at the QRPME Yahoo Group, look for the K1YPP photo album).
On a recent hike of the Camino de Santiago, in Spain, I used one set of batteries for the whole 500 mile hike and am still using the same batteries. They may seem more expensive than other batteries, but, as advertised, they do last 7-8 times as long (truly!) and if that is factored in, means they really are less expensive.
Charging is never an issue with these. Additionally, they are super light and the Bunny never seems to tire. If they ever did go dead, one could, as a temporary measure, use standard alkalines until replacement can be obtained.

9474. Troubleshooting ATS4B

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-06-30 19:39:38 UTC
From: andrew.cross
Topic: 9474 Message: 9474

Hello

I've finally gotten around to finishing the ATS4B over the past weeks or so and connected a 9V battery to it this morning. I've taken my time with this build and been as conscientious as possible so I have to admit that expectations were high for a working rig...but, no such luck I'm afraid, and it looks as though I am going to need to follow every step Steve has laid out in the manual, including the troubleshooting ones HI HI!

I don't have a lot of experience troubleshooting circuits, so I would be extremely grateful if I could get some help here.

Tests show the following:
On power up (9V batt at approx 7V charge) - the LCD screen lights up and stays lit, but no information appears on the screen - even if I hit the ON button, or even if I press and hold the FN button to 'turn it off'.
So, something is happening, which is encouraging. I hope its ok to post my measurements here directly, but I'm hoping that the info will assist in solving the issue - I've posted them below this message.

These are just the measurements I thought might help, and of course I can take and report others if needed.

Any or all help is appreciated to help in getting this radio working and on the air.

Many thanks
Andrew
F/M0ONZ

Using a DVM I have measured the following chips and their pins and came up with the following:

From: Philip L. Graitcer
Topic: 9476 Message: 9480

Only thing that disappoints me is that this is an evening event. I was hoping to be able to hike and set up somewhere under a tree with my ATS3b1 and MTR and operate. An evening sprint may require camping or operating from home QTH.

Any possibility to change time to an afternoon event?

Phil, W3HZZ

Hello folks,

Could not wait until tomorrow to start making QSOs with my MTR. I connected everything temporally yesterday night and fire it on the air on 20m.
- 1st QSO with AA3B who gave me 579 from PA
- 2nd QSO with SP5INQ who gave me 429!

The audio output is too soft for me. I have hearing loss so I will have to manage to have some amplification later.
I tried different earphones and they really make difference so for now I am good with an old one from apple.

Hope to see you in the air soon ...

72/73
Eric - VA3AMX

9482. Ear Bud Sensitivity

Yahoo group: AT_Sprint (2012 — 2013)

From: WA0ITP
Topic: 7686 Message: 9482

Ga Eric,

Ear bud sensitivity has been discussed occasionally on the list, and it's important. On the Ft Tuthill Yahoo Group Dan Tayloe, N7VE clarified ear bud sensitivity specs for us. The actual spec should xxx dB SPL/1mW. Most mfr don't include the whole callout, saying only xx dB, trying to make them appear more sensitive that they really are. The most sensitive that I've found are 112 dB SPL/1mW

I use both the Koss' "Plug" and their "Pathfinder"
Impedance 16 ohms
Sensitivity 112 dB SPL/1mW
Good sensitivity, much better than nearly all earbuds I've tried.
They perform very well and are comfortable.

Hope this helps

I love this radio stuff !

From: wmorrill@montana.edu
Topic: 9476 Message: 9483

Maybe someone is somehow in contact with Steve. If he needs help, they could relay information to me.
I offerred to bring supplies to Steve when he gets to Homestake Pass east of Butte, about a one hour drive for me. His response was that it would be difficult to schedule a meeting.
Lots of fires right now near here, but nothing appears to be in the area where Steve might be.
He has my phone number if he needs help and is able to call. He has a friend in West Yellowstone who also might help if needed. I have this person's name and phone number. I am guessing that Steve wants to be left alone, and would like avoid radio stuff for a while.
Anyway, I am here if needed. Home phone 406 five eight six 4209.

Eric,
I too have noticible hearing loss and have built andam using MTR 119 for the pas few months. I wondered it the low audio was due to a wrong compoment walue but the QSO's kept coming in. Finaly on Field Day I added an amplified speaker and what a difference it made! I will be using it from FN44 in VT in the AT Sprint and hope to work you. I could not belive the receiver selectivity in a contest situation for a $100 dollar rig. Steve is just a great designer. BTW a visit to my doctor confirmed the loss was not in the rig,

The only thing I'd prefer was to have multipliers by band.

I'll try to be on during the event on 40 & 20, which are the two of the three bands which are covered by the original AT-Sprint.

Dave and Terry - thanks for the comments.

Yes I remember the discussion about sensitivity specs a while ago and that's why I was trying different earphones. I just had no idea of how much was :)
I will try different earphones and phones to see which one will be more comfortable to me.

For the second week, the FOXHUNT is up for fun. AB9CA and I (WC7S) will be your FOXii for the evening.
14.060 plus or minus 10... and 0100z or on7pm MT ... We will be exchanging information including Signal Report
- QTH
- Operator's Name, and
- Power Output I'll be using a Hendricks KD1JV design Tri-bander, with a 100 ft center balanced fed doublet at 50ft. IF the band drops out and I need to change to the long antennnas, I will. The plan is to WAS with the Tri-Bander this season, I am also planning to use a puter logger, to assist with keeping the calls straight. Not that that is a garuntee.. but may be worth an effort. I will be tuning with RIT, around the edges of the pack, using the analog filter from Elecraft if I have to. So spread out and lets do it!! CQ FOX up.. dwn.. or nothing.. listen close. Good Luck!!

From: Johnny Matlock
Topic: 9490 Message: 9490

Hey guys:
Our family will be camping for a float trip this week end in NOEL MO.
I am planning on taking my ATS 4 and a Bert's Magic end fed, and see
what kind of qso's I can drum up!
We are arriving Friday night, and after camp setup I hope to be on the
air on 40 M.
I will try to post on QRPSPOTS.COM If we have internet connections.
If not I will be calling cq near the 7.122 freq
Come by and say hello.
Hope to work a bunch.
72, 73
Johnny AC0BQ

Hi Arthur, I found the listing. It is
ZXCT7008F “108” Orange, SOT-3 I'll check to see, let you know in a bit.But something is bugging me.... with the power off... lift one end of L7, and check with an ohm meter, to ground, the two pads that L7 connects to. Then before restoring L7, can you restore the collector of Q5? That protection circuit is pretty rock hard, I've not had one fail. However, I have been very convinced that it had, only to find a short.... and the protection circuit was adamit about not letting the magic smoke leak out.

Well Thanks Dale,
Im prity sure it is a bad ZXCT1008f due to finding a loose connection on R48 (r100) ristor causing the full load to be carried by the zx1008 chip

Well Thanks Dale,

Im prity sure it is a bad ZXCT1008f due to finding a loose connection on R48 (r100) ristor causing the full load to be carried by the zx1008 chip

> ZXCT7008F "108" Orange, SOT-3 I'll check to see, let you know in a bit.But something is bugging me.... with the power off... lift one end of L7, and check with an ohm meter, to ground, the two pads that L7 connects to. Then before restoring L7, can you restore the collector of Q5? That protection circuit is pretty rock hard, I've not had one fail. However, I have been very convinced that it had, only to find a short.... and the protection circuit was adamit about not letting the magic smoke leak out.

9500. Original ATS-3 Power Output

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-07-07 20:52:13 UTC
From: bill_w4zv
Topic: 9500 Message: 9500

I have the original ATS-3 (not 3A or 3B) built in 2005. Since then I got an LP-100A Wattmeter which allows accurate QRP measurements. I've tried tweaking the turns on L1 and L2 but cannot seem to get more than <4 Watts at 12VDC. I've searched the list archives but the comments, files, etc pertain to the 3A or 3B. I've looked over KX0R's files and notice his L and C values for the ATS-3A are fairly close to those for the ATS-3. Does anyone know if the values for the ATS-3A will also work for the original?

TU & 73!

From: Bob Flye
Topic: 9501 Message: 9501

Greetings all,
MTR S/N 30 has been on the air, but have noticed something interesting that I hope someone has insight to. If I am tuned to a strong station, there is an intermittent (10-15 seconds) popping sound in my earbuds. When listening to a weaker station, or simply band noise, I may hear a pop every once in a while, or not at all. Thoughts?

From: John Shadle
Topic: 9502 Message: 9502

Not sure if anyone saw this (probably not, since the bids are so low), but there's an auction up on eBay now (ends in 4 hours) for an ATS-3, ATS-3A, and a QBSA.

http://item.ebay.com/320938720336

I'm in no way affiliated with the person selling this, but thought others who want to get their hands on one of these would be interested. Right now the bidding is at $71 for all three. A veritable steal. I'd bid, but I've got too many unbuilt kits in the basement as it is.

I'd be leery of those ATS's. It appears a low quality of solder was used with a lot of yellow flux residue. Solder quality also appears poor at best. I suppose it could be a "fun" touchup/refurb project though.

Hi Bob. I throw a couple of random thoughts out there.

Do you experience this only at home? If you can, see if it still happens in one of your remote lunchtime radio excursions. Do something to rule out it's not anything in your house like an ac relay from HVAC, fridge, etc.

Charge build up on the antenna? If you're using a tuner that is DC isolated, maybe there is enough charge for it to build up and arc over somewhere. Maybe a 100k+ bleeder resistor on the antenna side for a before/after comparison.

It could be something in the radio design (haven't studied this enough to give suggestions) or grounding/floating setup. With the 10-15 popping rate, it seems like a slow buildup with a long time constant and have a hard time envision it being caused in the radio.

9505. Experience with fried output transistors?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-07-09 14:21:03 UTC
From: pgschreier
Topic: 9505 Message: 9505

During my last few SOTAs, I've been getting poor signal reports. I came home and measured my ATS-4 output, and running from 12.3V it's 1.70V p-p (= approx 0.6W) out instead of the 5+W I used to get.

I strongly suspect I fried the output transistors due to excessively high SWR (don't ask...).

Two questions:
1. I'm still getting 0.6W out -- so what's going on? Does this mean I'm running "barefoot", that is, the output stage is shorted out and the oscillator output is going to the antenna? (Amazingly, when I'm running a SOTA, those chasers have amazingly good ears -- I'm still getting 30+ QSOs from a summit.)

2. From those of you who might have had a similar experience, do I need to replace only the three MOSFETs, or do I have to replace additional components, as well?

thx, 73

From: jhg40earthlinknet
Topic: 9506 Message: 9506

I've been trying to get my MTR to work for the last month and a half or so.

On inital power up there was a loud hum in the headphones. Ultimately it blew R26. I believe the cuase was I had failed to make sure the band switches were all on one band. I replaced R26 and Q4.

Everyting seemed to work okay, but the rig lacked sensitivity. I could hear my other QRP transmitting into a Dummy load and I could peak the capacitors, but the rig will not pick up any 'on air' signals.

In trying to trouble shoot it I"ve lost the functionality of all the buttons except Tune Up.

Voltages on ICs are okay with the exception of the MPU. All voltages there are okay with the exception of P5 and P6 where I get 0 and .5v respectively vs. the correct of 2.7v and 1.7v. Sorry to say I've not been able to figure out why or how to fix it.

Any suggestions?

Any MTR techs for hire out there? (last step before I take it out and shoot it :) ?

One nice thing, A short lead on pin 8 of U2 and I get AM 940 and an adjacent am station quite nicely!

Thanks
Johh

Hi Paul, A check of the current being drawn during key down would be helpful too. Suspect the finals, all three, have left, and require changing. That should bring it back, especially if the current during key down returns to normal, after replacement. This is assuming that there are no issues with connectors or coax now.

9514. ATS-3 SWR Limit?

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-07-12 11:13:12 UTC
From: bill_w4zv
Topic: 9514 Message: 9514

From the ATS-3 (original) manual:

SWR

The ATS-3 transmitter can be keyed into an open circuit (no antenna connected) indefinitely. It will also tolerate a short circuit for relatively short periods of time, say 30
seconds. After this, the PA transistors start to get alarmingly hot! However, highly reactive
loads need to be avoided. Highly reactive loads can possibly cause the PA stage to become unstable. Although the PA is protected by a 46 volt zener diode across the drain/source terminals, very high SWR can cause the zener to heat up excessively and fail, usually by shorting. Possible problems with high SWR are most likely to happen if the rig is powered by a
12 volt supply and the transmitter producing a full 5 watts out.

Does anyone know Steve's definition of "highly reactive" or "very high SWR"? I've retweaked my BPFs for higher output (but still not 5W) and want to make sure I don't blow my finals when operating without a tuner.

Topic: 9514 Message: 9515

I run my original AT-Sprint (no suffix) just fine with 9 volts (nominal) 10.5 volts (when NiCD bank of cells are fully charged). It puts out a robust 3 watts, everything runs very cool, and the difference in S-Meter level at the other end isn't worth trying to reach the very limit of the PA. My 31' vertical has a SWR=3 on 40 metres without a matching device, yet I've made quite a few contacts and so far haven't blown the finals.

That's my take on the thing, YMMV.

Has anyone tried carbon fiber poles to support antenna, specifically, like an end-fed halfwave with the wire right on such a pole???

Does (or would) the carbon fiber interfere with an antenna (when the wire comes right down the pole)?

If it did interfere, how would one know????

From: Steve
Topic: 9519 Message: 9520

Fred,
Carbon fiber is conductive, although it may be bound into a non-conductive polymer or coating. While I have not used it in an antenna system, gut tells me that it may not be the best choice for an antenna support - at least from this perspective. While I don't know if one could consider a carbon fiber pole the same as, say a vinyl covered aluminum pole when placed in the near field of an antenna, I think if you approach your antenna design thinking along those lines you will have results closer to your expectations.

There have been boat fires caused by battery system shorts against carbon fiber hulls - which would not happen for non-conductive fiberglass hulls which in some ways look very similar. Further, corrosion issues as a result of galvanic action with carbon fiber hulls and various metallic fittings is an issue.

However the light weight sure makes it tempting for antenna supports!

Fred,

Carbon fiber is conductive, although it may be bound into a non-conductive polymer or coating. While I have not used it in an antenna system, gut tells me that it may not be the best choice for an antenna support - at least from this perspective. While I don't know if one could consider a carbon fiber pole the same as, say a vinyl covered aluminum pole when placed in the near field of an antenna, I think if you approach your antenna design thinking along those lines you will have results closer to your expectations.

Hi,

Just a few word my own experience.
For my Ground Plane and my hybrid Moxon I use cheap fishing poles that are labelled "carbon fiber".
However, being made in China, "Carbon Fiber" could just be some kind of branding.
I did not noticed any conductivity when testing with an ohm-meter and it seems more to colored glass fiber than real carbon fiber.
I never noticed any effect on the antenna behavior, everything work has expected with the models.

73,
Yan.

This kind of snuck up on me as July 1st was a Sunday, so .....

Tonight happens to be the July 2012 edition of the Run For The Bacon (this being the third Sunday of the month and all!). That friendly lil' ol' QRP Sprint sponsored by your friends at the Flying Pigs QRP Amateur Radio Club International. Join us for a spell to have some fun and to say "Hi" to friends, old and new.

The time is the same as always:

East coast - 9:00 to 11:00 PM local time
Midwest - 8:00 to 10:00 PM local time
Rockies - 7:00 to 9:00 PM local time
West coast - 6:00 to 8:00 PM local time

The rules are at:

http://fpqrp.org/pigrun/

9524. ATS-4b Save start- frequence

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-07-16 07:22:41 UTC
From: Karl Heinz
Topic: 9524 Message: 9524

Hello OM's!

After power up (Band 40m) my ATS-4b displays:

First line: MHz
2. line: 7.3 +
3. line:
4. line: -- 11.9V

No receiving signals.

After switch S7 80m return 40m displays 09.999.900 MHz
and audiotone without antenna connecting.

It is impossible change the band-start-frequency in DFE mode.

Programming interface cable.

All resistors R1-R5 = 220 Ohm ?

Who HAM can help me?

73

Karl, DL2XL

9525. NAQCC Sprint Wednesday night!

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-07-17 01:21:56 UTC
From: NAQCC
Topic: 2848 Message: 9525

NAQCC Sprint Wednesday night!

Our July sprint is this coming Wednesday evening local time (July 18, EST - 8:30-10:30PM, CST - 7:30-9:30PM, MST - 6:30-8:30PM, PST - 5:30-7:30PM), which translates as Thursday July 19, 0030-0230Z in all cases.

I will refer you to the proper URL:

http://naqcc.info/sprint201207.html

There you will find all the details as to time, frequencies and other important information.

Certificates: SWA (simple wire antennas) certificates by call area, VE and DX. A Certificate for top score in the GAIN antenna category. Finally there is one more award - a certificate to the highest score from a first-time participant.

Prizes: A prize of a set of bug/paddle handles or a K1/K2 knob insert donated by master woodworker Gregg WB8LZG is awarded for each sprint to the winner of a random drawing among all participants. Previous winners are not eligible.

This is a monthly event that caters to the CW veteran, the CW newcomer, straight key and bug fans. All are welcome to participate (this includes QRO); but you must use QRP power levels to compete for awards.

If you are not already a member of NAQCC... membership is FREE! Now is your chance to join the largest QRP CW Club in the world!! We currently have 6100+ members in: All 50 States - 9 VE Provinces - 90 Countries. Just sign up on the NAQCC website (http://naqcc.info/) and you will receive a handsome certificate, with your membership number which is good for life.

Come join us and have a real good time!

72/73 de Dave VA3RJ

So how many of you are going to be active?

I'm planning (WX es HF condx permitting) to be active from SOTA summit G/CE-001.
I'll have my ATS4 and MTR.

I think our best hope of a transatlantic QSO will be 20M, IF the band opens up.
I'll have an EFHW vertical for 20 and half square config for lower bands.

I hope it's worth staying out of bed for!

FOR SALE: a NEW 7 inch Window CE 6, "booklet" that arrived on my desk, intended to be a portable/mobile logger. I simply haven't gotten to do that. And honestly, I'm not sure when I will. I'm disappointed, but you won't be, if you want it. It has a mousepad, and keyboard. It came here for $100. It has wireless and does browsing nicely. Make an offer less than $100, before Saturday 0001z or 6pm Friday evening, and we'll get the addresses straight and I'll ship it by the weekend. Payment by Paypal or check. Please respond off list. Thank you for the bandwidth,Have a great day, Dale - WC7S in Wy

Hi All,

Just got my AT3A on the air and I plan on taking it on Backpacking trip next week.

I will be hiking the Chilkoot pass trail between Alaska and the Yukon.
I will try to get on as circumstances allow in the evening between July 21 and 27th.

Look for me around 14.061 at 13 WPM if you happen to be on.

This will be a serious problem for the AT-Sprint:

North American QSO Party on RTTY will be this Saturday July 21, 2012
New York-time: Saturday 2PM to Sunday 2AM EDST
California-time: Saturday 11AM to 11PM PDST.
UTC-time: Saturday 1800z to Sunday 0600z.

http://ncjweb.com/naqprules.php

If it wasn't the last minute, I'd strongly suggest a date change. Most will be running 100 Watts and will probably be all over the usual QRP frequencies.

The NAQP RTTY has been on contest calendars for years. It is always the Third full weekend in July. I've never operated with this contest featuring a 1930ish mode of operating, but with the advent of "plug and play" computer generated RTTY the mode has become more popular. I believe there is room for CW amongst the RATTy folks. We might need to move from the "14060" watering hole, in particular, because that's near the 14070 KHz recommended RTTY frequency. Fortunately, the AT-Sprint series are frequency agile.

One saving graces is the rule "Output power must be no more than 100 W for eligible entries."

BTW, QRP operation will be noted in the results writeup - anyone have a late version of the AT-Sprint which is capable of RTTY operating? That could be a blast!

It would also be a blast... if all stations would monitor before tx.... it is illegal to blast a cq.. right on top of an esstablished Qso. And don't even start with... the rtty stations do that.. they just can't hear qrp. That don't wash... no how.. no way.Besides illegal.. it is just simply plain rude. Now.. you know exactly how I feel. and rtty decode is also available during cw operation.. so don't start thinking that no one will know who .. either.

In QRP contests I cannot hear other stations outside my skip zone. That's always problem in QRP contests because backscatter using QRP to marginal antennas is non-existent. RTTY folks outside your skip zone will not hear you and will likely fire up on top of you without even knowing you're there. It's especially a problem because RTTY will be in the same general area of the band as QRP frequencies and there will be many times the number of QRP participants.

NAQP is a very popular RTTY contest with high activity (see results below). I just wanted to warn everyone, have no axe to grind and wish everyone good luck.

Oh I know Bill.. there will be a whole lot more of them.. that there are of qrp ops.. and back scatter is a small part of it.. sure. I used to run rtty a lot... and there is a different mindset there. In any case.. that's another topic.... I'm going to be having a blast with cw.. during the rtty test.. and they can't keep me frustrated the whole time. I'll find somewhere to make Qs.

You have a point, Bill, but

I've operated QRP in many, many contests (never RTTY) and never ceased to be amazed what 5 watts to a "cloud warmer" antenna can do amongst the KW crowd. My contest friends tell me "Life if too Short for QRP" but then I make 200 or more QSO's in 10 hours or so of piddling around with a contest.

If the "usual QRP frequencies" (and no one owns ANY frequencies) are occupied, try the very low end of each band, or on 40 metres try 7100 to 7125 KHz. Usually the lower 25 KHz of each band are wide open, even during the international DX contests, and I've never heard any contest activity between 7100 and 7125 KHz.

While that might be a good solution for home operations it wouldn't work too well for portable stations without Internet. I'd guess the best (non-Extra Class) place would be above 100 on all bands (e.g. 14100, 7100, etc).

Good luck to everyone!

I recently bought a QBSA assembled board from another ham to use with a ATS-3B that I should receive shortly.

To make a long story short it was not in the condition I was expecting. I knew the display was attached by ribbon cable to allow for more mounting options but I wasn't expecting the poor assembly job, lots of board resoldering jobs resulting in an ugly looking board. One wire from the toroid is broke off the board where it was soldered. It just generally needs to be completely cleaned up or rebuilt. That's not something I am prepared to undertake.

The good news is that when applying power the display lights up in the freq position with flickering numbers I contribute to not having an input. When cycling through the power and R power positions it lights up and the R shows up in the reverse power position.

That's the extent I know of it, it is sold as-is obviously. I paid way too much for it. I would like to get $50 for it shipped in the US, paypal preferred, but will take US postal money order.

I can send pictures of it tonight if no one says they will take it beforehand.

Thanks
Tim

I am going to try to be on. I will be using the ATS4b and an endfed antenna/Crappie pole somewhere. I have not decided where to operate at but I am thinking about a park down the road that I can walk to and can get 3G on the phone so I will be able to spot as well. Of course this is way past my bed time as I am in at work 0530 daily so I may have to nap in the afternoon first.

It's less than 24 hours away, and sure there will be some competition on the bands.. and that is ok.. yes, it may get frustrating, and somewhat tiring to have to work around... but you know what? If it were really easy... it wouldn't be a challange... and we all like challanges, right? So, here's one for you.... I challange each of you... to get on.. and have some fun... participate in the very first ATS-Sprint. Just do it. I will, I think I will work every one of the radios I have from Steve... each one.. no.. not at the same time... but that would be fun too.. put one on each band...hmmm... I could get them swapped into operation more that way... ... aw... just swapping radios is probably easier.. and less likely to screw something up. SO.. if I tell one of you one radio.. and someone else another... DON'T change the first entry in your log. And if I give each radio its own fair share of airtime..I'll be swapping every half hour. hmmm... I better get that arranged well... so I don't lose much time swapping. Ok.. I'm almost ready.. are you? See you in less than 24 hours.. (let's see... "cq ats, cq ats, cq ats... " yep, that works) Good luck

Dear Dale:

Here I am at the last minute, wondering about the details of the AT Sprint. Dumb me, but believe it or not, I don't seem to be able to find the most basic details re the contest, such as date, time, exchange, etc.

PLEASE re-send me the post telling me how to find the rules, TIA. Or call me after 1030 mountain time (SHhh....Holly is not getting better, actually worse before my very eyes 8-(.).

SORRY.....but I am losing her, seemingly by the minute. DaMN.

I plan to stay up to participate in the contest later - the start time is 2am local time here in Paris, France! I will try to operate both an ATS 4B and a MTR 20/40. Mainly on 20m, but also perhaps on 15m (with the 4B). I will probably self-spot on QRPSPOTS, particularly on 15m as my antenna for this band is resonant a little higher up the band at the moment.

I hope to hear and work some of you who are joining in for the fun. My CW skills are still at the fledgeling stage so although I will be trying not to be a nuisance, I do ask for your patience...if I can be heard in the first place! Now back to programming the memories of these fine radios.

Good luck to all.

All the best

I know of at least two European stations, that worked the Sprint, tonight, and likely more.. and there were a number of folks on that I couldn't hear.. but it was so much fun to get on and see all the friends around.. and to play with the rigs.. and just generally have fun on the radio. The bands weren't real good.. but then we stuck them out,anyway. Thank you all for helping to make this a success. It was a lot of fun, and I sure hope we can do it again. I had 17Qs on 20 and 40 with 4 rigs.. and at least 4 times that many friends heard.

Not terrific conditions here, and my "wonder wire" antenna was drooping lower than ever after some recent storms. Thus, I only scored 8 Qs (on 20 and 40), but I know I missed a few, too. Thanks to all who were there for an exchange.

Grandkid from Ohio visiting kept me from the AT-Sprint.

Would have liked to exhibit my "Original AT-Sprint" (no suffix) on the air. I've used it for one FOBB, but not very often.

What is amazing is that I spent 2 hours on 20 and only the last hour on 40... now I see that was flawed... pretty much a frayed rope. (note to self - hindsight is always better, if you plan on goin backwards from now on) It was great fun to me, to see all the good friends in the log, and others that I could hear, but not get into the log. I suppose the rather large thunderstorm to the north, may have had a little to do with that. I felt there were stations calling... and not getting into my ears. I used four radios.. the original Sprint, (from K0EVZ), the waterproof 3b (otherwise known as the "Yeller Feller", a take off on the PFR3), a MTR, and a TRI-Bander. Conditions seemed long, but noisy, I could just make out the east coast stations, and a couple VEs, but qsb and noise would cover them quickly. Ca stations were not nearly as strong as normal, and qsb was nippin on them too. I'm wondering... past the odd conditions, just how many stations were on, it will be interesting to see the logs, I have 10 unique calls in the log. I'm also wondering, how many different rigs were used. Was I the only one using a TriBander? Where were the PFR3s? Did most everyone go for the ATS mult?Some of this signals were way strong... and the next time I would hear them, they would be weak. That is somewhat typical, I suppose, for this time of year.I am already planning for the next one... wonder when it will be? Thanks to all that made this possible, and that is each and every one of you, even if you tried and didn't make a Q.. thank you all.See you next time, Have a great Sunday,

GM all:
Well it was a lot of fun to say the least.
I kept the ATS4B and the fresh off the bench MTR 40/20 warm to say the least!
The solder on the MTR was still cooling off when the sprint started!!!
I didn't fight with the RTTY boys much!
I had a lot of fun trying to figure out which rig Dale was putting on the air next!!!

Here is my rundown, and I think I missed one of Dales rig swaps at the end?
Looks like 11 as logged with one missed entry from Dale.
Great fun with sweet little rigs!!

From: Lee Hiers
Topic: 9569 Message: 9569

Wow. Talk about embarrassing. I discovered one of the problems with the ATS rigs last night - when I went to hook up my rig 5 minutes before the start of the contest, I couldn't find it! The doggone thing is so small...and I've got about 8 other Altoids boxes scattered around the shack...the ATS3b was nowhere to be seen! I remembered I'd taken the rig to the mountains over the 4th of July, but still couldn't find it in my suitcase. Hmmm. About 30 minutes into the contest, the rig appeared: zipped into a hidden pocket in my shaving kit!

Off to 20m and....nothing! I looked at QRPSpots and apparently condx were pretty horrible and 20m was already gone for the most part. I did some CQing even though I didn't hear anything...nothing showed up on the reverse beacon network, so off to 40m. And nothing to speak of. I heard a VE3 in QSO with a good signal, but not even much RTTY - none until I got above 7040. I did a little tuning, and a litte CQing. The reverse beacon network was picking me up pretty well, but I wasn't hearing much at all...so I wondered if my RX had a problem. Tuning around, I could hear one or two light QSOs and could even hear 5C13KD...but he couldn't hear me! So at least the RX seems to be working. I finally work NP4KT, but no one else - particularly frustrating since I was seeing a bit of activty on QRPSpots. I even hooked up the FT817 after the contest and tried 5C13KD again - he sounded about the same as on the ATS3b, but still couldn't hear me.

I'm glad some folks were making a few contacts anyway - to be honest, I'm surprised at some of the QSO totals I've seen reported - congrats!

Don't forget to send your logs in to atslogs@... and we'll get the results posted in a few weeks - the logs are starting to roll in - make sure yours is one of 'em!

9570. AT Sprint in the bag

Yahoo group: AT_Sprint (2012 — 2013)
Date: 2012-07-22 15:28:28 UTC
From: William
Topic: 9570 Message: 9570

Well, when I saw the SFI of 89 an A index of 11, I knew it was going to be rough going. Surprisingly the RTTY contest had no impact on my operating. 20 mtrs was the workhorse. Too much QRN on 40. This limited my ability to work local guys.

The guys I worked were:
AC0BQ
K4BAI
W0CH
WA5DBU
K0EVZ
K0JQZ
WB9QDL (has an ATS3 but unaware of contest)
WG0AT

I heard WC7S and WA9ETW but was unable to establish a qso. I heard none of the california or european guys even though I saw them spotted.

I was a little confused when I heard some guys using a TB or PFR. Are they counted as an ATS rig or just a Qrp rig?
In spite of the lousy propagation the test was still fun. It was the first time I heard what my rig sounds like on the air.
I think we should do it again. Maybe in the late fall so that we can better use 40 m.(also Steve will be back) This is a good time for portable ops. We should consider holding it during the week to avoid other contest conflicts and we should limit the bands to 40 and 20 so that we don't dilute ourselves and give the MTR guys a fair shake.

It never ceases to amaze me what this little rig and a bunch of AA batteries can do.

Bill, WV1N

9571. ATS Sprint - empty log

I set up operations at a friend's house in Surf City, NJ. I had my ATS4, MFJ971 tuner, NorCal doublet and an HFp vertical. I could hear plenty of stations around 7030 but nobody for the Sprint. Maybe next time.

2000 to 2300 local time makes it difficult to operate portable. All the parks close at dusk.

Topic: 9552 Message: 9572

Hello folks:

I just submitted my log with 7 QSOs. Had only 3 contacts with other ATS rigs, but very good to see participation from other QRP'ers.

No DX, heard here. Missed several possible Q's due to weak signals and/or poor timing on my part with WA6LTV, WA9ETW, AA9AA, W0UFO, WC7S, KB1NFC??.

Thanks for a fun evening. I hope we can do this again!

Interestingly enough, the strongest sigs all night on 20 belonged to W0UFO -- the WI/MN path seemed awfully short at the time, but who's to know? I also heard Bill in QSO on 40, similarly strong, but never heard him again after that (so, no QSO on the lower band). Doc was loud here on both bands, too, but he couldn't seem to hear me well enough to close the deal. Everyone else was well down by comparison, some farther than others. Deep QSB and a fairly high noise level complicated matters.

Qs in the book:

20: WC7S, AD7AN, W2LJ, K4BAI and W0UFO.

40: K4BAI, WC7S and AC0BQ,

Das ist alles.

72,

Mark -- WA9ETW

P.S. A couple of folks (on both bands) made pretty big moves to answer my calls, so I suspect something has happened to shift my XMIT freq off my RCVR freq by a bit. (No, the SPLIT function was not enabled.) I'll have to check that out. Sorry to those inconvenienced.

9574. Another suggestion for owners of the AT-Sprint series and offshoots thereof

Yahoo group: AT_Sprint (2012 — 2013)

How about encouraging owners of one of the rigs designed by Steve, KD1JV to try their hand at a "real contest." The next one is a "medium size, not totally hard core" event, namely the North American QSO party (CW) on 1800Z August 4 to 0600Z August 5, 2012 (First full weekend in August). Rules for the NAQP are at http://www.ncjweb.com/naqprules.php

I suspect that most all of the rigs designed by Steve have the same RF/IF chain, which would put the rigs at considerable disadvantage to the other participants of the QSO party, but the contest is limited to 100 watts or less, so there would be only ~ 13 dB disadvantage for the transmitter side of the equation.

I'd be willing to bet a dollar to a donut that even a mediocre op like me, with a mediocre antenna like me, and a "so-so" receiver like my AT-Sprint (no suffix) could work more than 100 Q's in the 10 hours permitted by the rules.

A "good op" with a "reasonable antenna" and one of the later AT-Sprint rigs (so 80 and 15 metres could be used), should do even better.

If there's any interest in doing so, I'll put my AT-Sprint to the test, and see whether I have good (or bad) prediction capability.

The NAQP has a team competition...If we can put together one full team (10 ops) that will use AT-rigs in next month's contest, I'd be up for it. I would think 100 QSOs is definitely do-able.

Lee:

Yup, there's a "QRP Noted" category, and the writeups always feature the Top 5 (or 10 if participation is great enough of QRPers) top QRP ops. AND, all scores from those who operate with <5 watts are noted with an (*) asterisk in the general score listing.

The teams may be from 2 to 5 ops per team, but if we'd have 10 who wanted to join, we could make two teams (or even three or more, if enough participation)

From the NAQP rules:

14. Team Competition: You may wish to form a team with fellow NAQP participants. If so, your team must consist of two to five single-operator stations whose individual scores are combined to produce a team score. Although clubs or other groups having more than five members may form multiple teams, there are no distance or meeting requirements for a team entry.

Teams must be registered prior to the start of the contest.

Note that many of the contest clubs/groups have both "full timers" and "part timers" in their teams - so if you can participate for part time, that would be FB with the contest.

AT-Sprint Team # 1: AA4GA, Op # 2 (is that you?), Op #3 (is that you?), Op #4 (is that you?), N8XX
AT-Sprint Team # 2 - wide open if the above gets filled.

I'd be willing to register the teams. Just send your interest to me, listing full or part time.

My philosophy is that if we QRP ops were to partook of more "real contests" we could dispel some of the myths amongst the contest community such as "life is too short for QRP," etc.

In addition to Hank's fine suggestion, how about the upcoming QRP ARCI Fall Qso Party in October - 1200Z on 13 October 2012 through 2400Z on 14 October 2012. We have Multi-Op and Team categories that might work out well for groups of the ATS rig ops. For the Multi-Op category, a multioperator effort may submit logs for a separate category so you could enter as a Multi-Op, All Band or Single Band. Any combination of operators and transmitters will be permitted although all transmitters must be located at a centralized location and all operators must use the same callsign in the multioperator category. For the Team category, you may enter as a team with an unlimited number of operators as long as no more than 5 transmitters are on the air concurrently.
You compete individually as well as on the team and teams need not be in the same location. Team captains must send a list of members to the Contest Manager
before the contest. I think that would be a great contest for ATS-centric groups to get togther and compete....72, Jim Rodenkirch K9JWV QRP ARCI Contest Manager

People, this sound good and fun, but you need to stablished specific goals and take care of one of the very delicate thing, the Logging system.

In my (very limited) experience contesting (only QRP) with my Elecraft rigs, I found few things. The logging is very important and not an easy task if your are not well connecting your radio and the computer. This is not possible with the ATS radios, not sure, but... So, the logging process need attention.

Second, the Strategy to follow. I sometimes keep moving up and down the band looking for multipliers instead of keep calling CQ on the same frequency. But if the condition and antennas are good, keep working on the same frequency making QSO is also good. Don't think the low power signal is not good making the pile-up. But I usually keep looking for multipliers and this is hard to log correct if the radio is not well connected to the logging system.

Ok, I sound to serious, don't take me wrong, but this need attention because the ATS limitations while operating at this level of complexity, make things hard to solve.

Believe me, working QRP make contesting a very full of emotions experience. Great!

Milton:

You're talking like many of my "big gun" contesting friends. I'm at "newbie" or "LID" level in their way of thinking. I suspect you're talking about the Rig controlling the frequency, etc. which appears on the computer logging software. IF you want this level of sophistication, you have a point. But, to do so is serious contesting. I can imagine that these data appear somewhere inside the AT-Sprint series of rigs, and someone like Steve, KD1JV could inform a "serious contester" where to find the info.

But this level of sophistication isn't necessary. Logging system can be as easy as paper and pen. I used paper and pen(cil) between 1951 and 1985 or so, when I started logging with a homebrew program within LOTUS 123 with my HP-110+ laptop.

Running 100 to 200 Q's in a contest could be logged with quill and papyrus, or with a logging computer not at all connected to the rig. I've used a bug (that's my preferred method if I don't have a computer connected to the rig), and a J-38 hand pump in "winning category" State QSO parties. One very easy program is the W3KM "General Logger" which has ability to run most contests, but which does NOT interface with the frequency and mode within the computer. And, it's FREE!

I haven't tried connecting the computer to the AT-Sprint rig for keying, which I typically do with my Drake TR-5. I'll try it before the Flight of the Bumblebees next weekend.

So, to the assembled multitude, "give it a try" - you may like doing QRP in the NAQP CW in August.

72/73 de n8xx Hg

p.s. May be count on you to be a part of an AT-Sprint team for NAQP CW?

No, the ATS rig can't communicate frequency to the logging computer, but
that's not a big problem really. A much bigger limitation is the bands
available, especially to MTR and older ATS users. One of the important
things to maximize in the NAQP is multiple
QSOs with each station - the ability to operate multiple bands is very
beneficial.

But I'm not looking to necessarily be at the top of the QRP listings - I'm
wanting to showcase QRP contesting as well as Steve's rigs. That said,
I'll still want to do as well as I can with the time I have available.

> But I usually keep looking for multipliers and this is hard to log correct
